
MOSES

Machine Translation with Open Source Software

Philipp Koehn and Hieu Hoang

2 September 2013

Outline

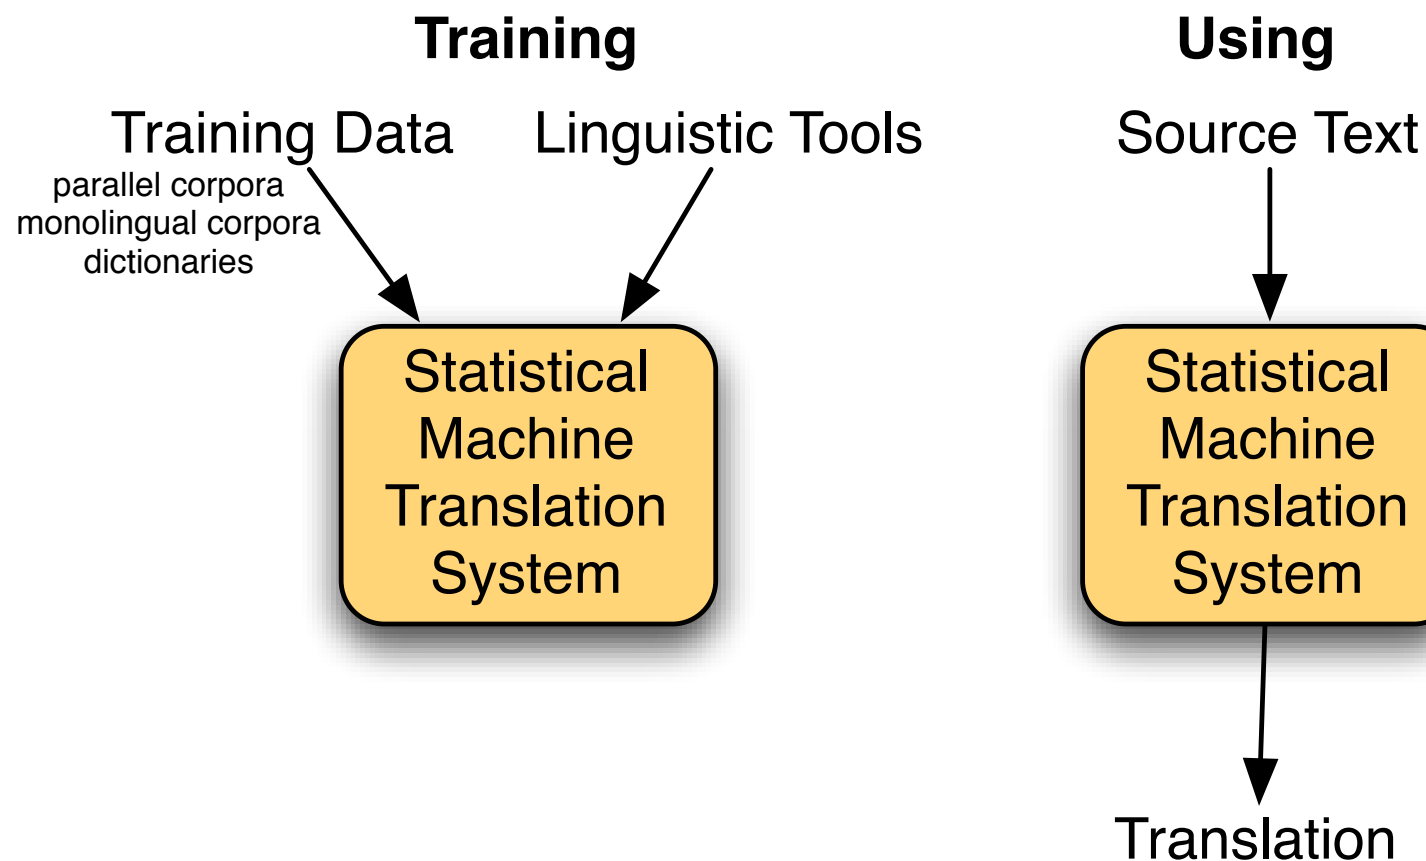

09:30-10:00 Introduction

10:00-11:00 Hands-on Session — you will need a laptop

11:00-11:30 Break

11:30-12:30 Advanced Topics

Basic Idea

Statistical Machine Translation History

around 1990

Pioneering work at IBM, inspired by success in speech recognition

1990s

Dominance of IBM's word-based models, support technologies

early 2000s

Phrase-based models

late 2000s

Tree-based models

Moses History

- 2002** Pharaoh decoder, precursor to Moses (phrase-based models)
- 2005** Moses started by Hieu Hoang and Philipp Koehn (factored models)
- 2006** JHU workshop extends Moses significantly
- since late 2006** Funding by EU projects EuroMatrix, EuroMatrixPlus
- 2009** Tree-based models implemented in Moses
- 2012** MosesCore project. Full-time staff to maintain and enhance Moses

Moses in Academia

- Built by academics, for academics
- Reference implementation of state of the art
 - researchers develop new methods on top of Moses
 - developers re-implement published methods
 - used by other researchers as black box
- Baseline to beat
 - researchers compare their method against Moses

Developer Community

- Main development at University of Edinburgh, but also:
 - Fondazione Bruno Kessler (Italy)
 - Charles University (Czech Republic)
 - DFKI (Germany)
 - RWTH Aachen (Germany)
 - others...
- Code shared on github.com
- Main forum: support and developer mailing lists
- Main event: Machine Translation Marathon (next: September 2011, Trento)
 - annual open source convention
 - presentation of new open source tools
 - hands-on work on new open source projects
 - summer school for statistical machine translation

Open Source Components

- Moses distribution uses external open source tools
 - word alignment: GIZA++, Berkeley aligner
 - language model: SRILM, IRSTLM, RANDLM
 - scoring: BLEU, TER, METEOR
- Other useful tools
 - sentence aligner
 - syntactic parsers
 - part-of-speech taggers
 - morphological analyzers

Other Open Source MT Systems

- **Joshua** — Johns Hopkins University
<http://joshua.sourceforge.net/>
- **CDec** — University of Maryland
<http://cdec-decoder.org/>
- **Jane** — RWTH Aachen
<http://www-i6.informatik.rwth-aachen.de/jane/>
- Very similar technology
 - Joshua implemented in Java, others in C++
 - Joshua and Jane support only tree-based models
 - Phrasal supports only phrase-based models
- Open sourcing tools increasing trend in NLP research

Moses in Industry

- Distributed with LGPL — free to use
- Competitive with commercial SMT solutions (Language Weaver, Google, ...)
- But:
 - not easy to use
 - requires significant expertise for optimal performance
 - integration into existing workflow not straight-forward

Case Studies

European Commission —

uses Moses in-house to aid human translators

Autodesk —

showed productivity increases in translating manuals when post-editing output from a custom-build Moses system

Systran —

developed statistical post-editing using Moses

Asia Online —

offers translation technology and services based on Moses

Many others ...

World Trade Organisation, Adobe, Symantec, WIPO, Sybase, Safaba

Phrase-Based Model

- Foreign input is segmented in phrases
- Each phrase is translated into English
- Phrases are reordered

Phrase Translation Options

er	geht	ja	nicht	nach	hause
he	is	yes	not	after	house
it	are	is	do not	to	home
, it	goes	, of course	does not	according to	chamber
, he	go	,	is not	in	at home
it is		not		home	
he will be		is not		under house	
it goes		does not		return home	
he goes		do not		do not	
	is		to		
	are		following		
	is after all		not after		
	does		not to		
	not				
	is not				
	are not				
	is not a				

- Many translation options to choose from

Phrase Translation Options

er	geht	ja	nicht	nach	hause
he	is	yes	not	after	house
it	are	is	do not	to	home
, it	goes	, of course	does not	according to	chamber
, he	go		is not	in	at home
it is		not		home	
he will be		is not		under house	
it goes		does not		return home	
he goes		do not		do not	
	is		to		
	are		following		
	is after all		not after		
	does		not to		
	not				
	is not				
	are not				
	is not a				

- The machine translation decoder does not know the right answer
 - picking the right translation options
 - arranging them in the right order
- Search problem solved by heuristic beam search

Decoding: Precompute Translation Options¹⁴

consult phrase translation table for all input phrases

Decoding: Start with Initial Hypothesis

15

initial hypothesis: no input words covered, no output produced

Decoding: Hypothesis Expansion

pick any translation option, create new hypothesis

Decoding: Hypothesis Expansion

create hypotheses for all other translation options

Decoding: Hypothesis Expansion

also create hypotheses from created partial hypothesis

Decoding: Find Best Path

backtrack from highest scoring complete hypothesis

Computational Complexity

- The suggested process creates exponential number of hypothesis
 - Reduction of search space: pruning
- Decoder may not find the model-best translation

Factored Representation

- Factored representation of words

- Goals
 - generalization, e.g. by translating lemmas, not surface forms
 - richer model, e.g. using syntax for reordering, language modeling)

Factored Model

Example:

Decomposing the translation step

Translating lemma and morphological information more robust

Syntax Models

String to String

John misses Mary

⇒ Marie manque à Jean

String to Tree

John misses Mary

Tree to String

⇒ Marie manque à Jean

Tree to Tree

Syntax Decoding

Syntax Decoding

Syntax Decoding

Syntax Decoding

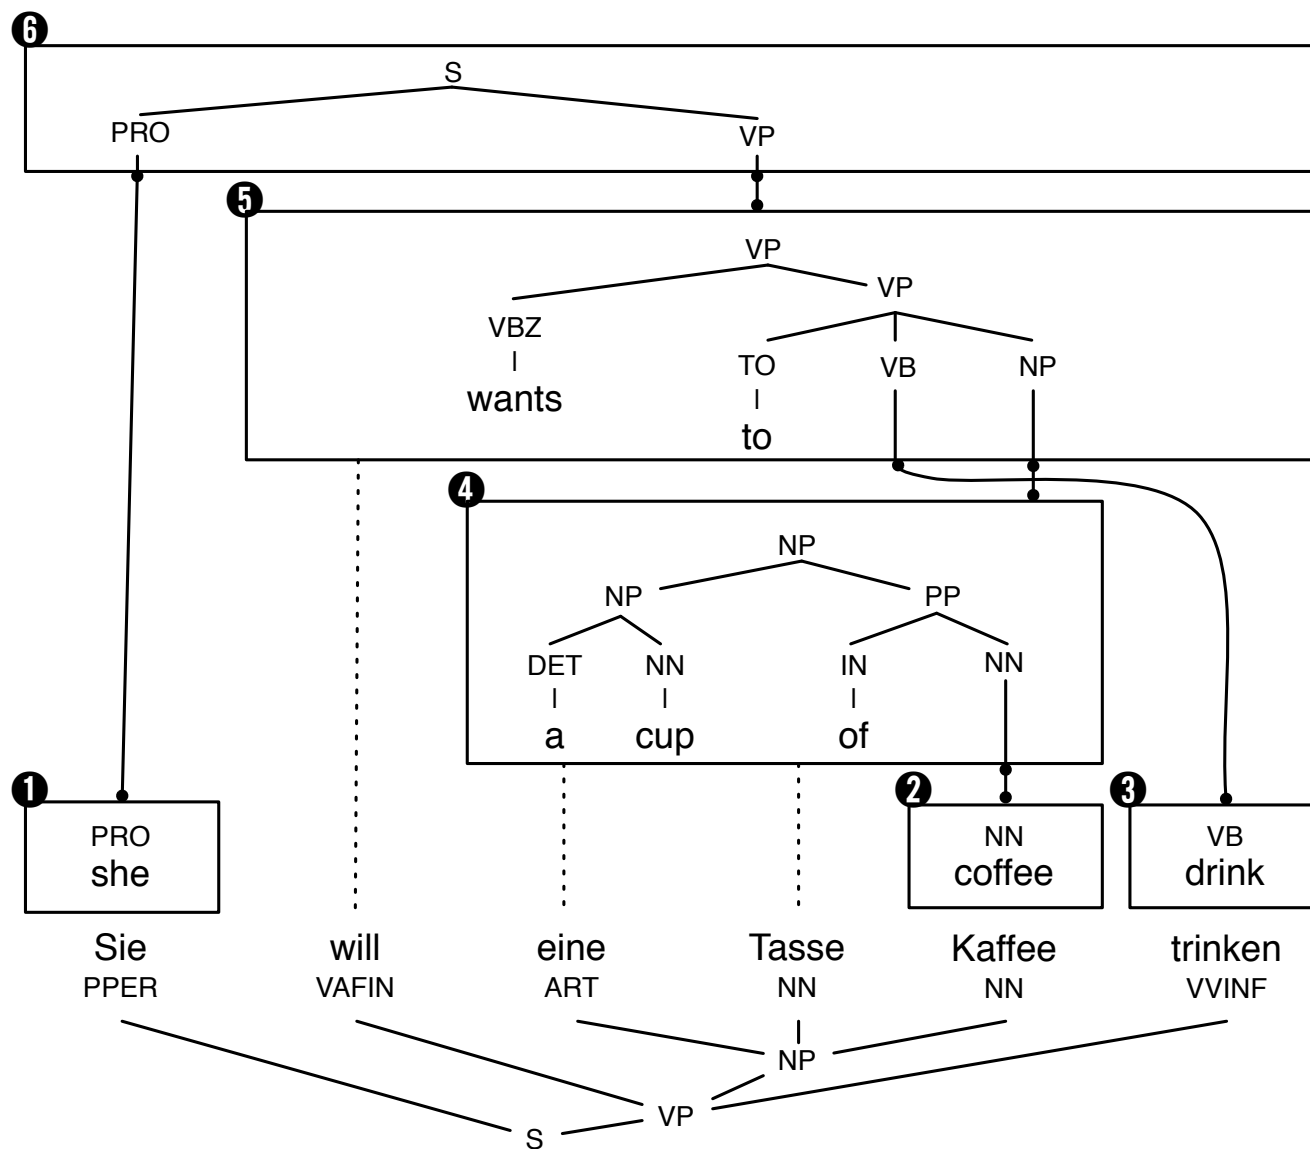

Syntax Decoding

5

Advanced Topics

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- Output formats
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

Hands-On Session

Advanced Topics

Advanced Features

- **Data and domain adaptation**
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- Output formats
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

Data

- Parallel corpora → translation model
 - sentence-aligned translated texts
 - translation memories are parallel corpora
 - dictionaries are parallel corpora
- Monolingual corpora → language model
 - text in the target language
 - billions of words easy to handle

Domain Adaptation

- The more data, the better
- The more in-domain data, the better
(even in-domain monolingual data very valuable)
- Multiple models
 - train a translation model for each domain corpus
 - train a language model for each domain corpus
 - use all, tune weights for each model
 - alternative: interpolate language model
- Always tune towards target domain

Advanced Features

- Data and domain adaptation
- **Speed vs. quality**
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- Output formats
- Translation models
- Experiment management system

Speed

- Easy speed-up: multi-threaded decoding

```
--threads NUM
```

- Requires boost library
- Does not currently work for:
 - syntax-based decoding
 - IRSTLM
 - randLM

Speed vs. Quality

- Decoder search creates very large number of partial translations ("hypotheses")
- Decoding time \sim number of hypotheses created
- Translation quality \sim number of hypothesis created

Hypothesis Stacks

- Phrase-based: One stack per number of input words covered
- Number of hypothesis created =
sentence length \times stack size \times applicable translation options

Pruning Parameters

- Regular beam search
 - `--stack NUM` max. number of hypotheses contained in each stack
 - `--ttable-limit NUM` max. num. of translation options per input phrase
 - search time roughly linear with respect to each number
- Cube pruning
(fixed number of hypotheses are added to each stack)
 - `--search-algorithm 1` turns on cube pruning
 - `--cube-pruning-pop-limit NUM` number of hypotheses added to each stack
 - search time roughly linear with respect to pop limit
 - note: stack size and translation table limit have little impact in speed

Syntax Hypothesis Stacks

- One stack per input word span
- Number of hypothesis created = $\text{sentence length}^2 \times \text{number of hypotheses added to each stack}$
`--cube-pruning-pop-limit NUM` number of hypotheses added to each stack

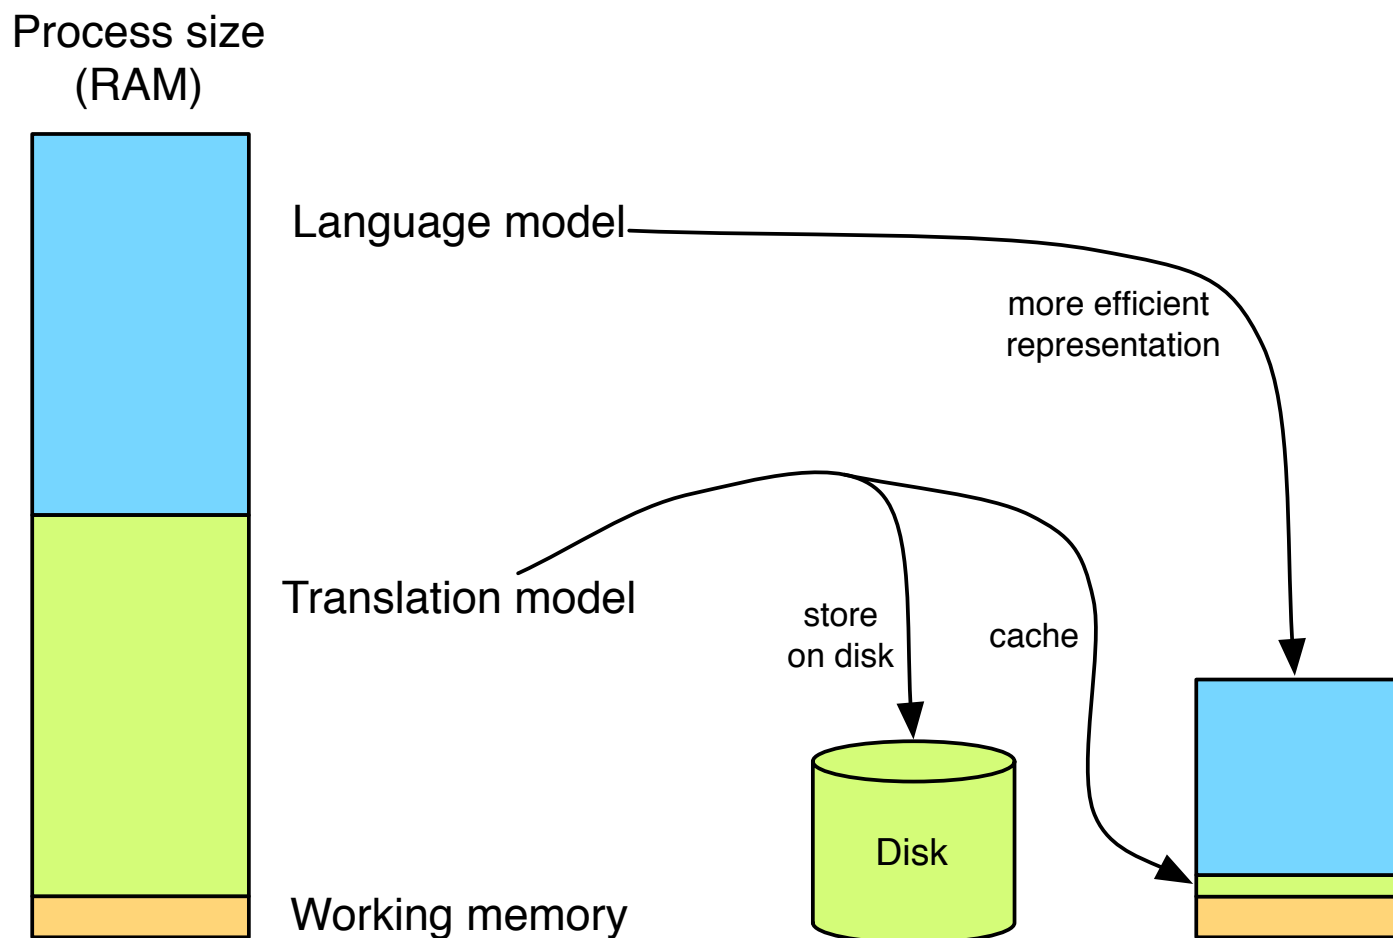

Trade-Off Speed vs Quality

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- **Speed vs. memory use**
- Language models
- Instructions to decoder
- Input formats
- Output formats
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

Speed vs. Memory Use

Speed vs. Memory Use

Typical Europarl file sizes:

- Language model
 - 170 MB (trigram)
 - 412 MB (5-gram)
- Phrase table
 - 11GB
- Lexicalized reordering
 - 9.4GB

→ total = 20.8 GB

Process size
(RAM)

Speed vs. Memory Use

- Load into memory
 - fast decoding
 - large memory usage
 - large load time
- Load-on-demand
 - store indexed model on disk
 - binary format
 - minimal start-up time, memory usage
 - slower decoding

Speed vs. Memory Use

Phrase Table:

Phrase-based

```
export LC_ALL=C
cat pt.txt | sort | ./processPhraseTable -ttable 0 0 - \
    -nscores 5 -out out.file
```

Hierarchical / Syntax

```
export LC_ALL=C
./CreateOnDiskPt 1 1 5 100 2 pt.txt out.folder
```

Lexical Reordering Table:

```
export LC_ALL=C
processLexicalTable -in r-t.txt -out out.file
```

Language Models (later)

Speed vs. Memory Use

Change ini file

Phrase-based

```
[ttable-file]  
1 0 0 5 out.file
```

Hierarchical / Syntax

```
[ttable-file]  
2 0 0 5 out.folder
```

Lexical Reordering Table

```
[distortion-file]  
0-0 wbe-msd-bidirectional-fe-allff 6 out.file
```

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- **Language models**
- Instructions to decoder
- Input formats
- Output formats
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

Language Models

- Probability of the output
- Very important in MT, for all SMT models → improve fluency
- Huge amount of training data easy to obtain
 - monolingual
 - can scrape from websites etc.
- But:
 - training takes a long time
 - large memory requirement during decoding
 - large load time
- IRSTLM and RandLM especially designed to tackle large data issues

IRSTLM

52

- Developed by FBK-irst, Trento, Italy
- Create a binary format which can be read from disk as needed
 - reduces memory but slower decoding
- Quantization of probabilities
 - reduces memory but lose accuracy
 - probability stored in 1 byte instead of 4 bytes

IRSTLM in Moses

- Compile the decoder with IRSTLM library

```
./configure --with-irstlm=[root dir of the IRSTLM toolkit]
```

- Change ini file to use IRSTLM implementation

```
[lmodel-file]  
1 0 3 file/path
```

IRSTLM: Training

- Specialized training for large corpora

- parallelization
- reduce memory usage

- Training:

```
build-lm.sh -i "gunzip -c corpus.gz" -n 3  
            -o train.irstlm.gz -k 10
```

- `-n 3` = n-gram order
- `-k 10` = split training procedure into 10 steps

IRSTLM: Binary Format

- Create binary format:

```
compile-lm language-model.srilm language-model.blm
```

- Load-on-demand:

```
rename file .mm
```

Randomized language model

- For huge corpora (e.g. 100 billion words)
- Lossy compression
 - Makes false positive mistakes
 - frequency of mistakes can be varied with a parameter
- Typically $\frac{1}{10}$ size of SRI / IRST language model
- Maybe use as secondary LM to complement conventional LM
 - out-of-domain data scraped from the web
 - high-order n-gram, eg. 6-7 gram

RandLM: Use in Moses

- Compile the decoder with RandLM library

```
./configure --with-randlm=[root dir of the RandLM toolkit]
```

- Change ini file to use RandLM implementation

```
[lmodel-file]  
0 0 3 /path/to/file    # conventional lm  
5 0 7 /path/to/file    # rand lm
```

RandLM: Training

- Train from text corpus

```
./buildlm -struct BloomMap -falsepos 8 -values 8 -order 3  
-output-prefix model  
< corpus.txt
```

- Convert SRILM language model

```
./buildlm -struct BloomMap -falsepos 8 -values 8 -order 3  
-output-prefix model  
-input-path lm.srilm -input-type arpa
```

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- **Instructions to decoder**
- Input formats
- Output formats
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

Specifying Translations with XML

- Translation tables for numbers?

f	e	$p(f e)$
2003	2003	0.7432
2003	2000	0.0421
2003	year	0.0212
2003	the	0.0175
2003

- Instruct the decoder with XML instruction

the revenue for <num translation="2003"> 2003 </num> is higher than ...

- Deal with different number formats

er erzielte <num translation="17.55"> 17,55 </num> Punkte .

Walls and Zones

- Specification of reordering constraints
- Zone
sequence to be translated without reordering with outside material
- Wall
hard reordering constraint, no words may be reordered across
- Local wall
wall within a zone, not valid outside zone

Walls and Zones: Examples

- Requiring the translation of quoted material as a block

He said <zone> " yes " </zone> .

- Hard reordering constraint

Number 1 : <wall/> the beginning .

- Local hard reordering constraint within zone

A new plan <zone> (<wall/> maybe not new <wall/>) </zone> emerged .

- Nesting

The <zone> " new <zone> (old) </zone> " </zone> proposal .

Preserving Markup

- How do you translate this:

`<h1>My Home Page</h1>`
I really like to `eat` chicken!

- Solution 1: XML translations, walls and zones

```
<x translation="<h1>" /> <wall/> My Home Page <wall/>  
<x translation="</h1>" />
```

```
I really like to <zone><x translation="<b>" /> <wall/> eat <wall/>  
<x translation="</b>" /> </zone> chicken !
```

(note: special XML characters like `<` and `>` need to be escaped)

Preserving Markup

- Solution 2: Handle markup externally

- track word positions and their markup

I	really	like	to	eat	chicken	!
1	2	3	4	5	6	7
-	-	-	-		-	-

- translate without markup

I really like to eat chicken !

- keep word alignment to source

Ich	esse	wirklich	gerne	Hühnchen	!
1	5	2	3-4	6	7

- re-insert markup

Ich esse wirklich gerne Hühnchen!

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- **Input formats**
- Output formats
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

Example: Misspelt Words

- Misspelt sentence:

The room was *exellent but the hallway was *filty .

- Strategies for dealing with spelling errors:
 - Create correct sentence with correction
 - ✗ problem: if not corrected properly, adds more errors
 - Create many sentences with different corrections
 - ✗ problem: have to decode each sentence, slow

Confusion Network

The room was *excellent but the hallway was *filthy .

Input to decoder:

Let the decoder decide

Example: Diacritics

- Correct sentence

Trung Quốc cảnh báo Mỹ về luật tiền tệ

- Something a non-native person might type

Trung Quoc canh bao My ve luat tien te

- Confusion network

Confusion Network Specification

Argument on command line

```
./moses -inputtype 1
```

Input to moses

```
the 1.0  
room 1.0  
was 1.0  
excel 0.33 excellent 0.33 excellence 0.33  
but 1.0  
the 1.0  
hallway 1.0  
was 1.0  
guilty 0.5 filthy 0.5
```

Lattice

Example: Chinese Word Segmentation

- Unsegmented sentence

硬质合金号称"工业牙齿"

- Incorrect segmentation

硬质 合 金 号称 " 工 业牙 齿 "

- Correct segmentation

硬 质 合金 号称 " 工业 牙齿 "

Lattice

Input to decoder:

Let the decoder decide

Example: Compound Splitting

- Input sentence

einen wettbewerbsbedingten preissturz

- Different compound splits

- Let the decoder decide

Lattice Specification

Command line argument

```
./moses -inputtype 1
```

Input to Moses (PLF format - Python Lattice Format)

```
(  
  (  
    ('einen', 1.0, 1),  
  ),  
  (  
    ('wettbewerbsbedingen', 0.5, 2),  
    ('wettbewerbs', 0.25, 1),  
    ('wettbewerb', 0.25, 1),  
  ),  
  (  
    ('bedingen', 1.0, 1),  
  ),  
  (  
    ('preissturz', 0.5, 2),  
    ('preis', 0.5, 1),  
  ),  
  (  
    ('sturz', 1.0, 1),  
  ),  
)
```

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- **Output formats**
- Minimum Bayes risk decoding
- Translation models
- Experiment management system

N-Best List

- Input

es gibt verschiedene andere meinungen .

- Best Translation

there are various different opinions .

- Next nine best translations

there are various other opinions .
there are different different opinions .
there are other different opinions .
we are various different opinions .
there are various other opinions of .
it is various different opinions .
there are different other opinions .
it is various other opinions .
it is a different opinions .

Uses of N-Best Lists

- Let the translator choose from possible translations
- Reranker
 - add more knowledge sources
 - can take global view
 - coherency of whole sentence
 - coherency of document
- Used to tune component weights

N-Best Lists in Moses

Argument to command line

```
./moses -n-bestlist n-best.file.txt [distinct] 100
```

Output

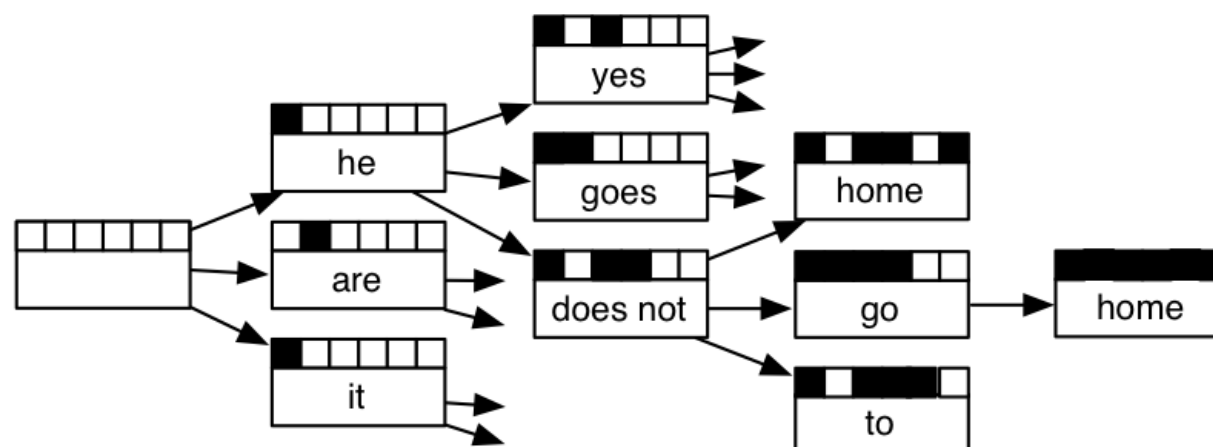

```
0 ||| there are various different opinions . ||| d: 0 lm: -21.6664 w: -6 ... ||| -113.734
0 ||| there are various other opinions . ||| d: 0 lm: -25.3276 w: -6 ... ||| -114.004
0 ||| there are different different opinions . ||| d: 0 lm: -27.8429 w: -6 ... ||| -117.738
0 ||| there are other different opinions . ||| d: -4 lm: -25.1666 w: -6 ... ||| -118.007
0 ||| we are various different opinions . ||| d: 0 lm: -28.1533 w: -6 ... ||| -118.142
0 ||| there are various other opinions of . ||| d: 0 lm: -33.7616 w: -7 ... ||| -118.153
0 ||| it is various different opinions . ||| d: 0 lm: -29.8191 w: -6 ... ||| -118.222
0 ||| there are different other opinions . ||| d: 0 lm: -30.426 w: -6 ... ||| -118.236
0 ||| it is various other opinions . ||| d: 0 lm: -32.6824 w: -6 ... ||| -118.395
0 ||| it is a different opinions . ||| d: 0 lm: -20.1611 w: -6 ... ||| -118.434
```

Search Graph

- Input

er geht ja nicht nach hause

- Return internal structure from the decoder

- Encode millions of other possible translations
(every path through the graph = 1 translation)

Uses of Search Graphs

- Let the translator choose
 - Individual words or phrases
 - 'Suggest' next phrase
- Reranker
- Used to tune component weights
 - More difficult than with n-best list

[1] New probe into US attorney affair >>
 Neuer Vorstoß in den USA Anwalt neue Affäre sonde (9 edits)

neue sonde

Search Graphs in Moses

Argument to command line

```
./moses -output-search-graph search-graph.file.txt
```

Argument to command line

```
0 hyp=0 stack=0 forward=36 fscore=-113.734
0 hyp=75 stack=1 back=0 score=-104.943 ... covered=5-5 out=.
0 hyp=72 stack=1 back=0 score=-8.846 ... covered=4-4 out=opinions
0 hyp=73 stack=1 back=0 score=-10.661 ... covered=4-4 out=opinions of
```

- hyp - hypothesis id
- stack - how many words have been translated
- score - total weighted score
- covered - which words were translated by this hypothesis
- out - target phrase

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- Output formats
- **Minimum Bayes risk decoding**
- Translation models
- Experiment management system

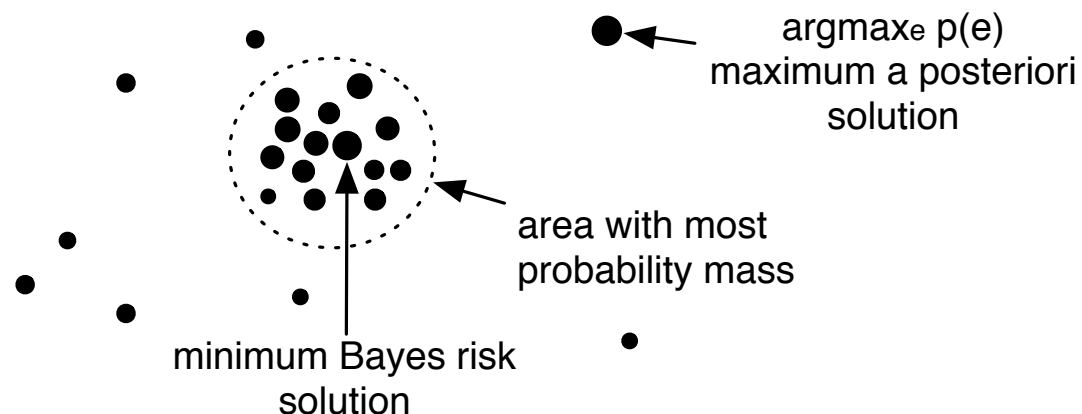

Minimum Bayes Risk Decoding

- Normal (MAP) decoding:

$$\hat{t} = \operatorname{argmax}_t p(t|s)$$

- MBR decoding:

$$\hat{t} = \operatorname{argmax}_t \sum_{t' \in T} p(t'|s) \times \text{bleu}(t', t)$$

Minimum Bayes Risk Decoding

- Set of translations $t' \in T$

$$\hat{t} = \operatorname{argmax}_t \sum_{t' \in T} p(t'|s) \times \operatorname{bleu}(t', t)$$

- Using n-best list:

```
moses -f moses.ini -i in.txt -mbr
```

- Using lattice:

```
lmbrgrid ... -f moses.ini -i input.txt
```

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- Output formats
- Minimum Bayes risk decoding
- **Translation models**
- Experiment management system

Phrase-Based Model

- Advantages

- fast: under half a second per sentence for fast configuration
- low-memory requirement
 - * 200-300MB for lowest configuration
 - * suitable for netbooks and mobile devices
- outperform more complicated models for many language pairs
 - * especially for related languages pairs

- Command line

```
./moses -f moses.ini -i in.txt > out.txt
```

- Output

```
there are various different opinions .
```

Hierarchical Models

Advantages

- able to model non-contiguous phrases
 - ne..pas → not
- low-memory requirement
 - 200-300MB for lowest configuration
 - suitable for netbooks and mobile devices
- outperform phrase-based models when translating between widely different languages
 - Chinese-English consistently better with hierarchical model
 - better at medium range re-ordering
- Linguistically motivated

Disadvantages

- slower
 - 0.5 - 2 sec for fastest configuration
- more memory requirement
 - 1-2GB ram
- more disk usage
 - translation model $\times 10$ larger than phrase-based

Command line `./moses-chart -f moses.ini -i in.txt > out.txt`

Syntax Models

- Hierarchical model + use of syntactic information (constituency parser, chunkers)
- Advantage
 - Can use outside linguistic information
 - promises to solve important problems in SMT, eg. long-range reordering
- Disadvantages
 - difficult to get right
 - for many language pairs still worse than phrase-based and hierarchical models
 - need syntactic parse information
 - * unreliable
 - * available only for some languages
 - * not designed for machine translation

Moses Tree Representation

```

- <tree label="TOP">
  - <tree label="NP">
    <tree label="NE"> Musharrafs </tree>
    <tree label="ADJA"> letzter </tree>
    <tree label="NN"> Akt </tree>
  </tree>
  <tree label="PUNC"> ? </tree>
</tree>
  
```

Phrase-Based Model Training

- Command line

```
train-model.perl ...
```

- Model

```
Bndnisse ||| alliances ||| 1 1 1 1 2.718 ||| ||| 1 1  
General Musharraf betrat am ||| general Musharraf appeared on ||| 1 1 1 1 2.718 ||| ||| 1 1
```

Hierarchical Model Training

- Command line

```
train-model.perl ... -hierarchical
```

- Example rule from model

```
Bündnisse [X][X] Kräften [X] ||| alliances [X][X] forces [X] ||| 1 1 1 1 2.718 ||| 1-1 ||| 0.0526316 0.0526316
```

- Visualization of rule

Tree-to-String Model Training

- Command line

```
train-model.perl ... -source-syntax
```

- Example rule from model

```
Bündnisse [PP][X] [NP] ||| alliances [PP][X] [X] ||| 1 1 1 1 2.718 ||| 1-1 ||| 1 1
```

- Visualization of rule

String to Tree Model Training

- Command line

```
train-model.perl ... -target-syntax
```

- Example rule from model

```
von [X][NPB] und [X][NPB] [X] ||| with [X][NPB] and [X][NPB] [PP] ||| ...
```

- Visualization of rule

Tree-to-Tree Model Training

- Command line

```
train-model.perl ... -source-syntax -target-syntax
```

- Example rule from model

```
seine Stellung und Manahmen [CNP] ||| his position and actions [NPB] ||| ...
```

- Visualization of rule

Syntax Models Decoding in Moses

- String-to-string (hierarchical) or string-to-tree

```
./moses-chart -f moses.ini -i in.txt > out.txt
```

- Tree-to-string or tree-to-tree

```
./moses-chart -f moses.ini -i in.txt -inputtype 3 > out.txt
```

Advanced Features

- Data and domain adaptation
- Speed vs. quality
- Speed vs. memory use
- Language models
- Instructions to decoder
- Input formats
- Output formats
- Minimum Bayes risk decoding
- Translation models
- **Experiment management system**

Running Experiments

Execute a lot of scripts

```
tokenize < corpus.en > corpus.en.tok  
lowercase < corpus.en.tok > corpus.en.lc  
...  
mert.perl ....  
moses ...  
mteval-v13.pl ...
```

Change a part of the process, execute everything again

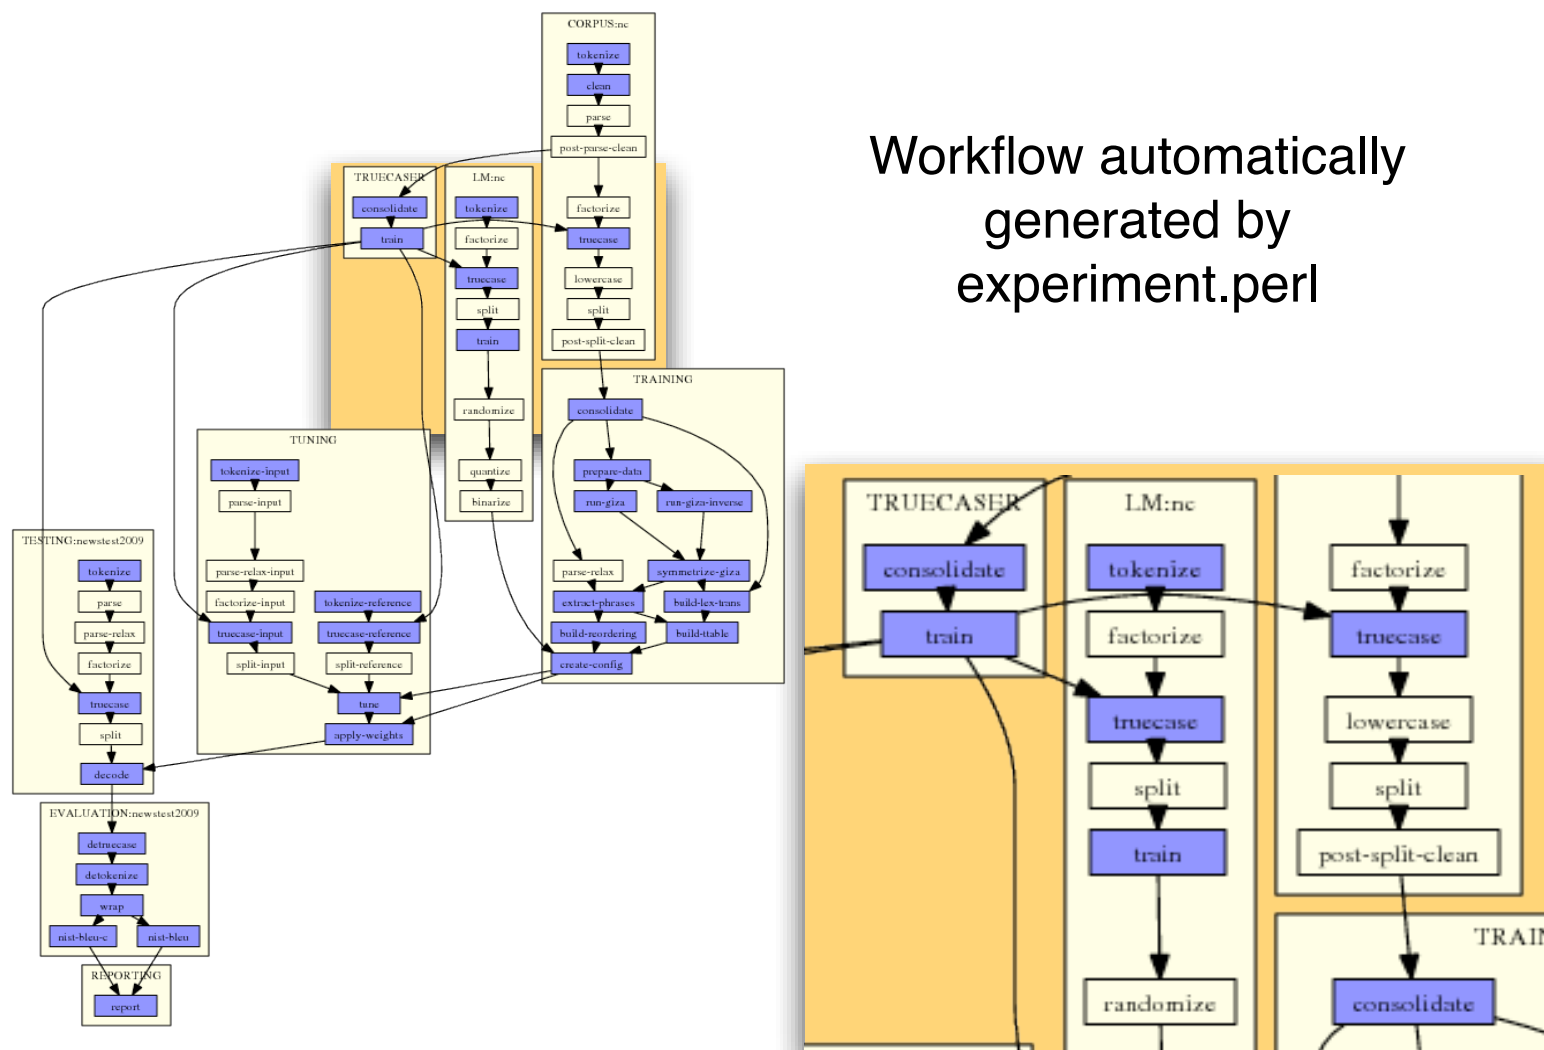

```
tokenize < corpus.en > corpus.en.tok  
lowercase < corpus.en.tok > corpus.en.lc  
...  
mert.perl ....  
moses ...  
mteval-v13.pl ...
```

Experiment Management System

- One configuration file for all settings: record of all experimental details
- Scheduler of individual steps in pipeline
 - automatically keeps track of dependencies
 - on single machine, multi-core machines, GridEngine clusters
 - parallel execution
 - crash detection
 - automatic re-use of prior results
- Fast to use
 - set up a new experiments in minutes
 - set up a variation of an experiment in seconds

Workflow automatically
generated by
experiment.perl

How does it work?

- Write a configuration file (typically by adapting an existing file)

- Execute:

```
experiment.perl -config config
```

Web Interface
