

---

# MOSES

## Machine Translation with Open Source Software

Hieu Hoang and Matthias Huck

October 2014

# Outline

**09:30-10:15    Introduction**

**10:15-11:00    Hands-on Session** — you will need a laptop

**11:00-11:30    Break**

**11:30-12:30    Advanced Topics**

Slides downloadable from

<http://www.statmt.org/moses/amta.2014.pdf>

# Basic Idea

# Statistical Machine Translation History

## **around 1990**

Pioneering work at IBM, inspired by success in speech recognition

## **1990s**

Dominance of IBM's word-based models, support technologies

## **early 2000s**

Phrase-based models

## **late 2000s**

Tree-based models

# Moses History

- 2002** Pharaoh decoder, precursor to Moses (phrase-based models)
- 2005** Moses started by Hieu Hoang and Philipp Koehn (factored models)
- 2006** JHU workshop extends Moses significantly
- 2006-2012** Funding by EU projects EuroMatrix, EuroMatrixPlus
- 2009** Tree-based models implemented in Moses
- 2012-2015** MosesCore project. Full-time staff to maintain and enhance Moses

# Moses in Academia

- Built by academics, for academics
- Reference implementation of state of the art
  - researchers develop new methods on top of Moses
  - developers re-implement published methods
  - used by other researchers as black box
- Baseline to beat
  - researchers compare their method against Moses

# Developer Community

- Main development at University of Edinburgh, but also:
  - Fondazione Bruno Kessler (Italy)
  - Charles University (Czech Republic)
  - DFKI (Germany)
  - RWTH Aachen (Germany)
  - others . . .
- Code shared on [github.com](https://github.com)
- Main forum: Moses support mailing list
- Main event: Machine Translation Marathon
  - annual open source convention
  - presentation of new open source tools
  - hands-on work on new open source projects
  - summer school for statistical machine translation

# Open Source Components

- Moses distribution uses external open source tools
  - word alignment: GIZA++, MGIZA, BERKELEYALIGNER, FASTALIGN
  - language model: SRILM, IRSTLM, RANDLM, KENLM
  - scoring: BLEU, TER, METEOR
- Other useful tools
  - sentence aligner
  - syntactic parsers
  - part-of-speech taggers
  - morphological analyzers

## Other Open Source MT Systems

- **Joshua** — Johns Hopkins University  
<http://joshua.sourceforge.net/>
- **CDec** — University of Maryland  
<http://cdec-decoder.org/>
- **Jane** — RWTH Aachen  
<http://www.hltpr.rwth-aachen.de/jane/>
- **Phrasal** — Stanford University  
<http://nlp.stanford.edu/phrasal/>
- Very similar technology
  - Joshua and Phrasal implemented in Java, others in C++
  - Joshua supports only tree-based models
  - Phrasal supports only phrase-based models
- Open sourcing tools increasing trend in NLP research

# Moses in Industry

- Distributed with LGPL — free to use
- Competitive with commercial SMT solutions  
(Google, Microsoft, SDL Language Weaver, . . . )
- But:
  - not easy to use
  - requires significant expertise for optimal performance
  - integration into existing workflow not straight-forward

# Case Studies

## **European Commission —**

uses Moses in-house to aid human translators

## **Autodesk —**

showed productivity increases in translating manuals when post-editing output from a custom-build Moses system

## **Systran —**

developed statistical post-editing using Moses

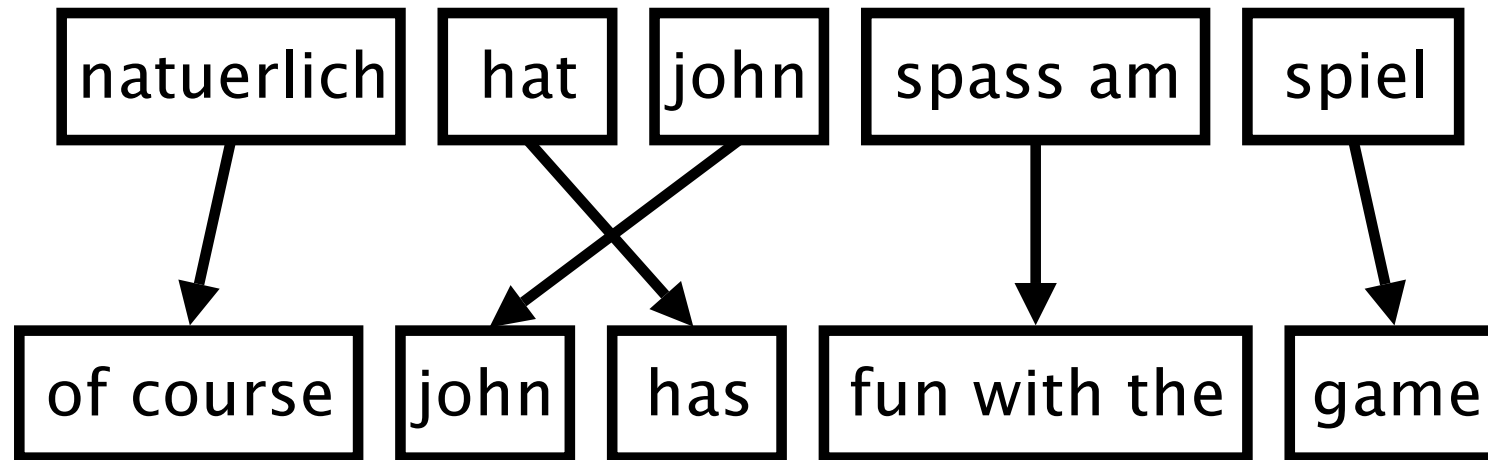

## **Asia Online —**

offers translation technology and services based on Moses

## **Many others . . .**

World Trade Organisation, Adobe, Symantec, WIPO, Sybase, Safaba, Bloomberg, Pangeanic, KatanMT, Capita, . . .

# Phrase-based Translation

- Foreign input is segmented in phrases
- Each phrase is translated into English
- Phrases are reordered

# Phrase Translation Options

er	geht	ja	nicht	nach	hause
he	is	yes	not	after	house
it	are	is	do not	to	home
, it	goes	, of course	does not	according to	chamber
, he	go	,	is not	in	at home
it is		not		home	
he will be		is not		under house	
it goes		does not		return home	
he goes		do not		do not	
	is		to		
	are		following		
	is after all		not after		
	does		not to		
	not				
	is not				
	are not				
	is not a				

- Many translation options to choose from

# Phrase Translation Options

er	geht	ja	nicht	nach	hause
he	is	yes	not	after	house
it	are	is	do not	to	home
, it	goes	, of course	does not	according to	chamber
, he	go		is not	in	at home
it is		not		home	
he will be		is not		under house	
it goes		does not		return home	
he goes		do not		do not	
	is		to		
	are		following		
	is after all		not after		
	does		not to		
	not				
	is not				
	are not				
	is not a				

- The machine translation decoder does not know the right answer
    - picking the right translation options
    - arranging them in the right order
- Search problem solved by beam search

# Decoding: Precompute Translation Options<sup>14</sup>

consult phrase translation table for all input phrases

# Decoding: Start with Initial Hypothesis

15

initial hypothesis: no input words covered, no output produced

# Decoding: Hypothesis Expansion

pick any translation option, create new hypothesis

# Decoding: Hypothesis Expansion

create hypotheses for all other translation options

# Decoding: Hypothesis Expansion

also create hypotheses from created partial hypothesis

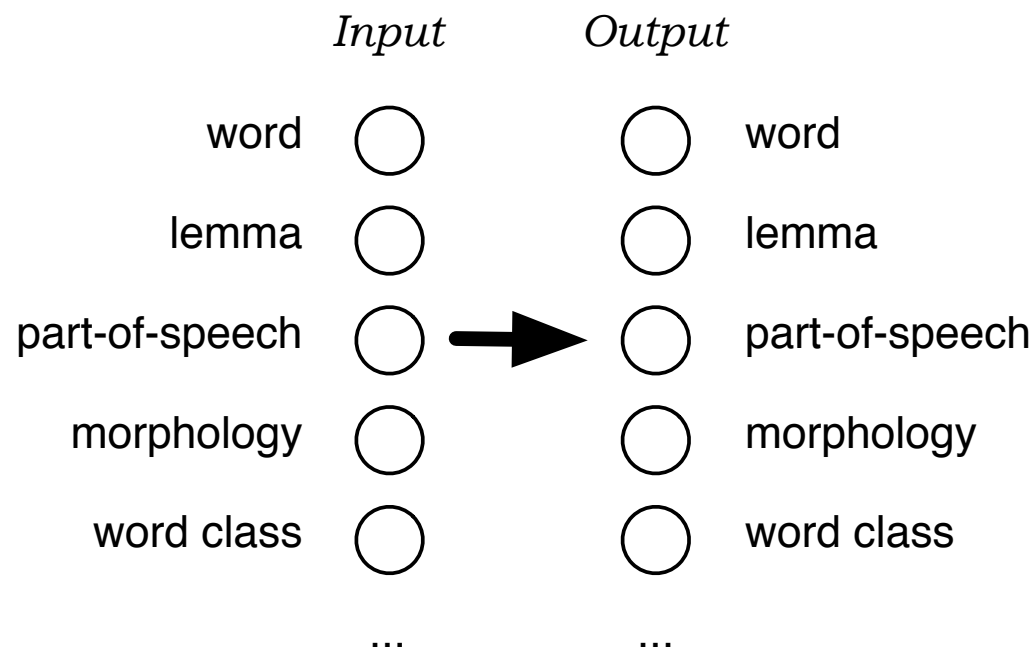

# Decoding: Find Best Path

backtrack from highest scoring complete hypothesis

# Factored Translation

- Factored representation of words

- Goals
  - generalization, e.g. by translating lemmas, not surface forms
  - richer model, e.g. using syntax for reordering, language modeling

# Factored Model

Example:

Decomposing the translation step

Translating lemma and morphological information more robust

# Syntax-based Translation

## String-to-String

John misses Mary

⇒ Marie manque à Jean

## String-to-Tree

John misses Mary

## Tree-to-String

## Tree-to-Tree

# Syntax-based Decoding

23

# Syntax-based Decoding

24

# Syntax-based Decoding

25

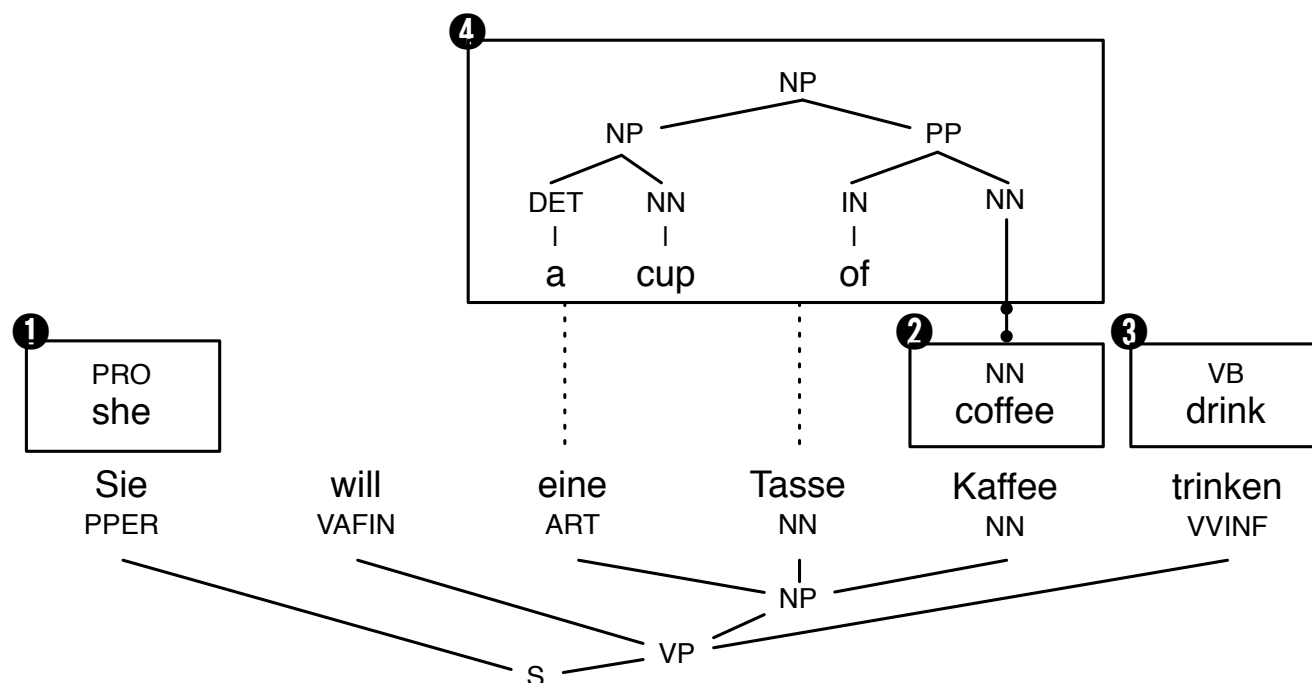

# Syntax-based Decoding

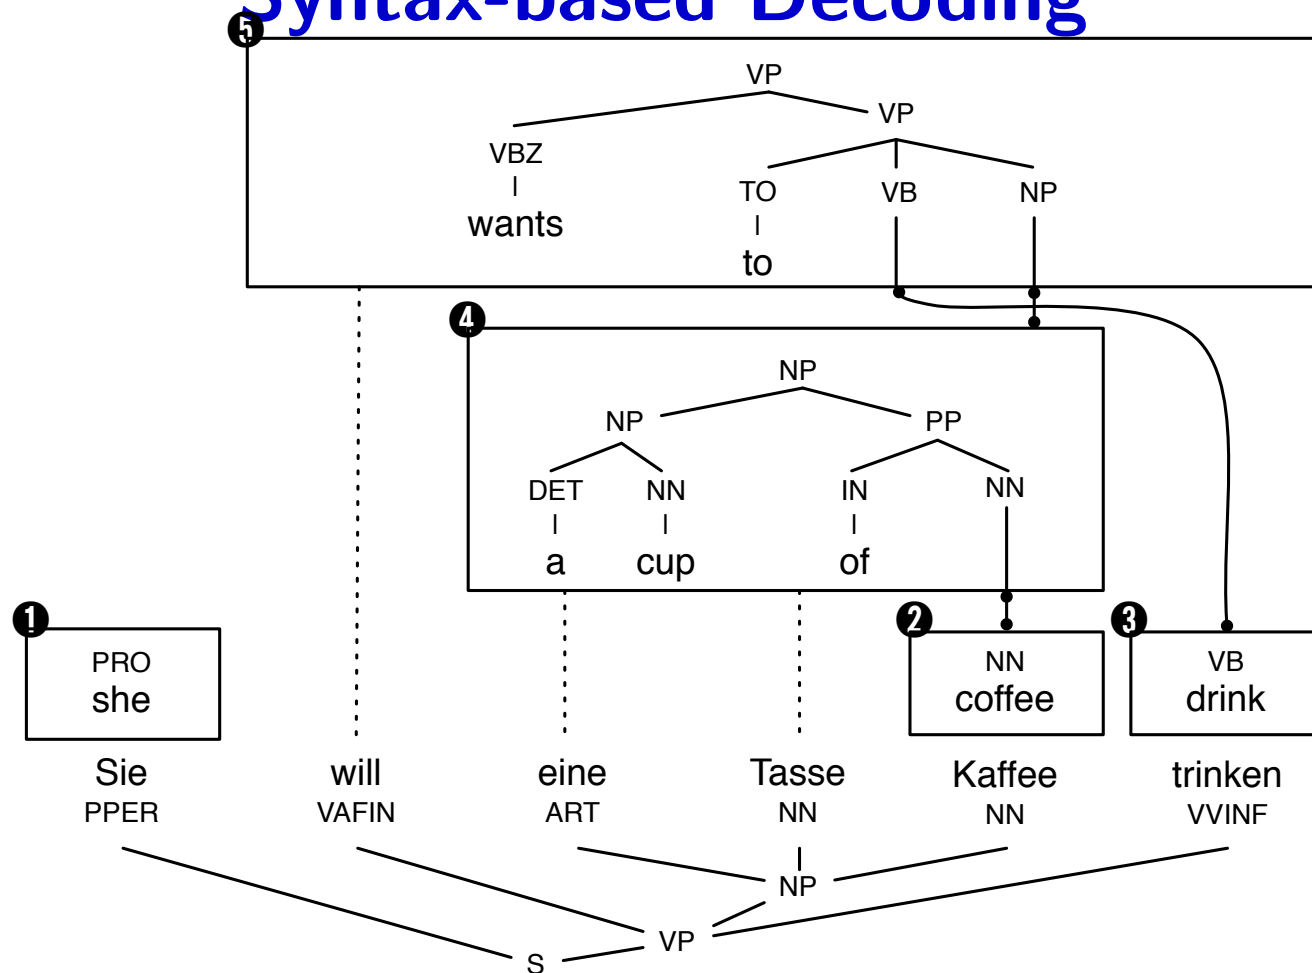

26

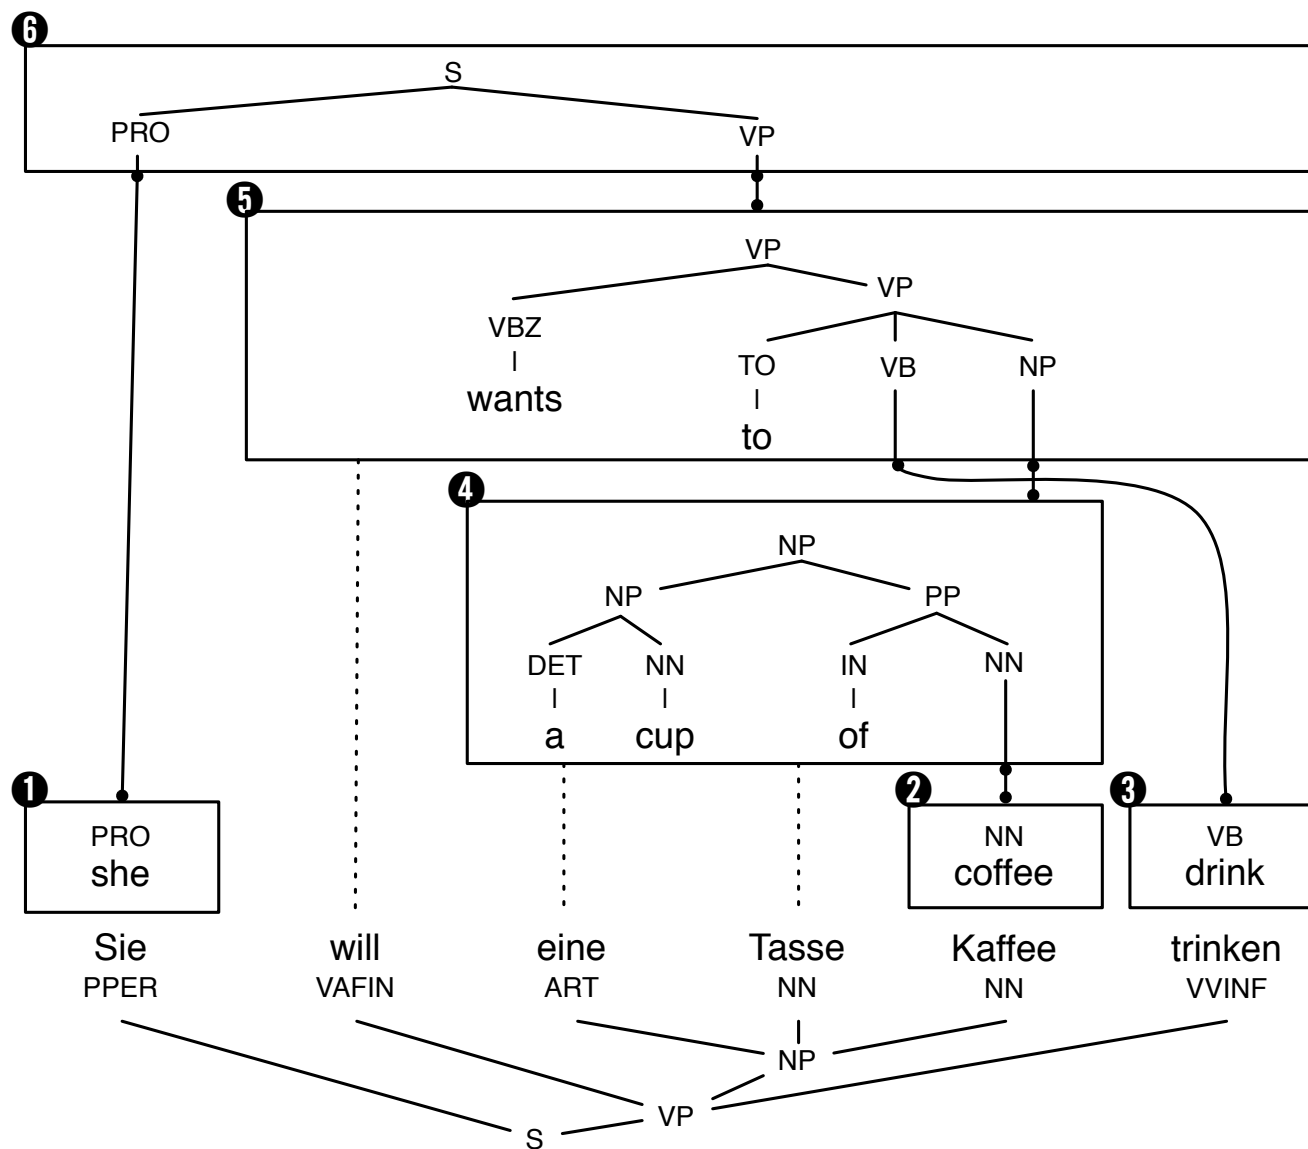

# Syntax-based Decoding

# Syntax-based Decoding

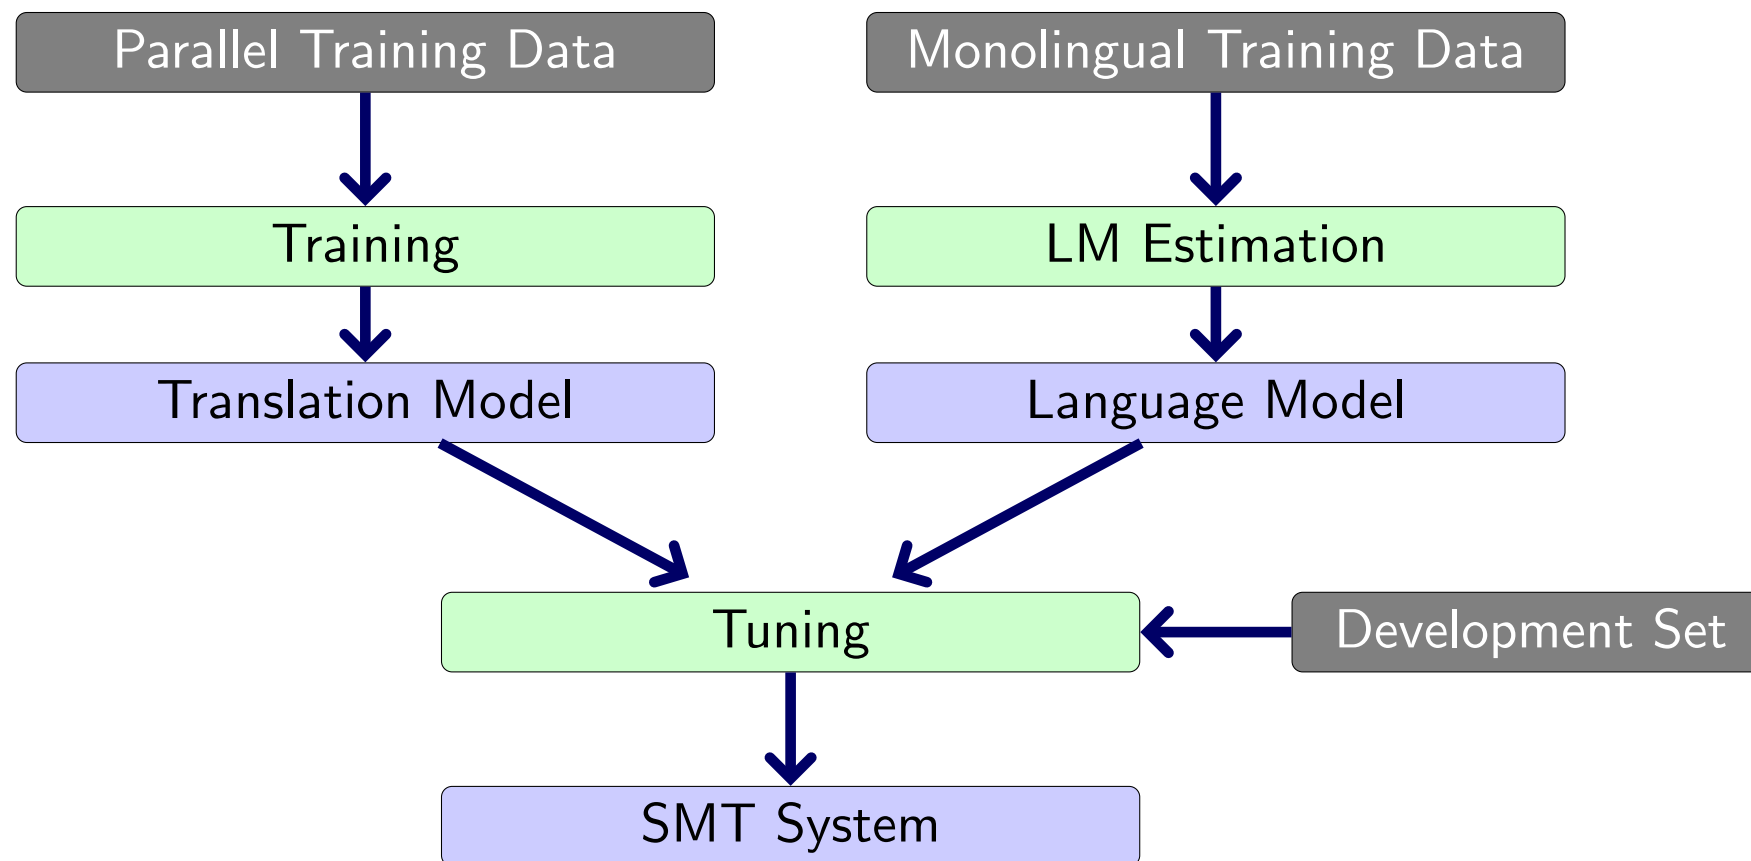

# How do I get started?

- Collect your data
  - Parallel data
    - \* Freely available data, e.g. Europarl, MultiUN, WIT3, OPUS, . . .
    - \* TAUS, Linguistic Data Consortium (LDC), . . .
  - Monolingual data
    - \* CommonCrawl, WMT News Crawl corpus, . . .
- Set up Moses
  - Download source code for Moses, GIZA++, MGIZA
  - Compile, install
  - Or use precompiled Moses packages (Windows, Linux, Mac OS X)
  - More info: <http://www.statmt.org/moses/>
- Train system

# Data-driven MT

# Moses Pipeline

Execute a lot of scripts

```
tokenize < corpus.en > corpus.en.tok  
lowercase < corpus.en.tok > corpus.en.lc  
...  
mert.perl ....  
moses ...  
mteval-v13.pl ...
```

Change a part of the process, execute everything again

```
tokenize < corpus.en > corpus.en.tok  
lowercase < corpus.en.tok > corpus.en.lc  
...  
mert.perl ....  
moses ...  
mteval-v13.pl ...
```

# Phrase-based Model Training with Moses<sup>33</sup>

- Command line

```
train-model.perl ...
```

- Example phrase from model

```
Bndnisse ||| alliances ||| 1 1 1 1 2.718 ||| ||| 1 1  
General Musharraf betrat am ||| general Musharraf appeared on ||| 1 1 1 1 2.718 ||| ||| 1 1
```

# Phrase-based Decoding with Moses

- Command line

```
moses -f moses.ini -i in.txt > out.txt
```

- Advantages

- fast — under half a second per sentence for fast configuration
- low memory requirements — ~200MB RAM for lowest configuration
- state-of-the-art translation quality on most tasks, especially for related language pairs
- robust — does not rely on any syntactic annotation

- Disadvantages

- poor modeling of linguistic knowledge and of long-distance dependencies

# Hierarchical Model Training with Moses

35

- Hierarchical model:  
formally syntax-based, without linguistic annotation (string-to-string)
- Command line

```
train-model.perl -hierarchical ...
```

- Example rule from model

```
Bündnisse [X][X] Kräften [X] ||| alliances [X][X] forces [X] ||| 1 1 1 1 2.718 ||| 1-1 ||| 0.0526316 0.0526316
```

- Visualization of rule

# Hierarchical Decoding with Moses

- Command line

```
moses_chart -f moses.ini -i in.txt > out.txt
```

- Advantages

- able to model non-contiguities like *ne . . . pas* → *not*
- better at medium-range reordering
- outperforms phrase-based systems when translating between widely different languages, e.g. Chinese-English

- Disadvantages

- more disk usage — translation model  $\times 10$  larger than phrase-based
- slower — 0.5 - 2 sec/sent. for fastest configuration
- higher memory requirements — more than 1GB RAM

# Syntax-based Model Training with Moses<sup>37</sup>

- Command line

```
train-model.perl -ghkm ...
```

- Example rule from model

```
[X][NP-SB] also wanted [X][ADJA] [X][NN] [X] ||| [X][NP-SB] wollten auch die [X][ADJA] [X][NN] [S-TOP] ||| ...
```

# Syntax-based Decoding with Moses

- Command line

```
moses_chart -f moses.ini -i in.txt > out.txt
```

(like hierarchical)

- Advantage

- can use outside linguistic information
- promises to solve important problems in SMT, e.g. long-range reordering

- Disadvantages

- training slow and difficult to get right
- requires syntactic parse annotation
  - \* syntactic parsers available only for some languages
  - \* not designed for machine translation
  - \* unreliable

# Experiment Management System

- EMS automates the entire pipeline
- One configuration file for all settings: record of all experimental details
- Scheduler of individual steps in pipeline
  - automatically keeps track of dependencies
  - parallel execution
  - crash detection
  - automatic re-use of prior results
- Fast to use
  - set up a new experiment in minutes
  - set up a variation of an experiment in seconds
- Disadvantage: not all Moses features are integrated

# How does it work?

- Write a configuration file (typically by adapting an existing file)

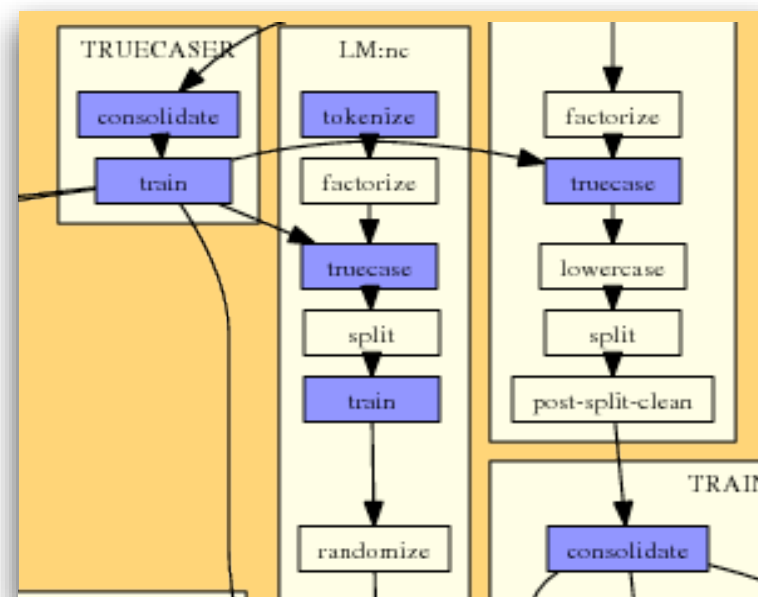

- Test:

```
experiment.perl -config config
```

- Execute:

```
experiment.perl -config config -exec
```

Workflow automatically  
generated by  
experiment.perl

# Web Interface

sortable by most improvement, deterioration

# Hands-On Session

# Advanced Features

- **Faster Training**
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Incremental Training

# Advanced Features

- **Faster Training**
  - Tokenization
  - Tuning
  - Alignment
  - Phrase-Table Extraction
  - Train language model

. . .

# Faster Training

- Run steps in parallel (that do not depend on each other)

- Multicore Parallelization

```
.../train-model.perl -parallel
```

- EMS:

```
[TRAINING]  
parallel = yes
```

# Advanced Features

- Faster Training
  - **Tokenization**
  - Tuning
  - Alignment
  - Phrase-Table Extraction
  - Train language model

. . .

# Faster Training

- Multi-threaded tokenization
- Specify number of threads

```
.../tokenizer.perl -threads NUM
```

- EMS:

```
input-tokenizer = "$moses-script-dir/tokenizer/tokenizer.perl  
-threads NUM "
```

# Advanced Features

- Faster Training
  - Tokenization
  - **Tuning**
  - Alignment
  - Phrase-Table Extraction
  - Train language model

. . .

# Faster Training

- Multi-threaded tokenization
- Specify number of threads

```
.../mert -threads NUM
```

- EMS:

```
tuning-settings = "-threads NUM"
```

# Advanced Features

- Faster Training
  - Tokenization
  - Tuning
  - **Alignment**
  - Phrase-Table Extraction
  - Train language model

. . .

# Faster Training

- Word Alignment
- Multi-threaded
  - Use MGIZA, not GIZA++

```
.../train-model.perl -mgiza -mgiza-cpus NUM
```

EMS:

```
training-options = " -mgiza -mgiza-cpus NUM "
```

- On: memory-limited machines
  - snt2cooc program requires 6GB+ memory
  - Reimplementation uses 10MB, but take longer to run

```
.../train-model.perl -snt2cooc snt2cooc.pl
```

EMS:

```
training-options = "-snt2cooc snt2cooc.pl"
```

# Advanced Features

- Faster Training
  - Tokenization
  - Tuning
  - Alignment
  - **Phrase-Table Extraction**
  - Train language model

. . .

# Faster Training

- Phrase-Table Extraction
  - Split training data into NUM equal parts
  - Extract concurrently

```
.../train-model.perl -cores NUM
```

# Faster Training

- Sorting
  - Rely heavily on Unix 'sort' command
  - may take 50%+ of translation model build time
  - Need to optimize for
    - \* speed
    - \* disk usage
  - Dependent on
    - \* sort version
    - \* Unix version
    - \* available memory

## Faster Training

- Plain sorted

```
sort < extract.txt > extract.sorted.txt
```

- Optimized for large server

```
sort --buffer-size 10G --parallel 5  
    --batch-size 253 --compress-program [gzip/pigz] ...
```

- Use 10GB of RAM — the more the better
- 5 CPUs — the more the better
- mergesort at most 253 files
- compress intermediate files — less disk i/o

- In Moses:

```
.../train-model.perl -sort-buffer-size 10G -sort-parallel 5  
    -sort-batch-size 253 -sort-compress pigz
```

# Advanced Features

- Faster Training
  - Tokenization
  - Tuning
  - Alignment
  - Phrase-Table Extraction
  - **Train language model**

. . .

# IRSTLM: Training

- Developed by FBK-irst, Trento, Italy
- Specialized training for large corpora
  - parallelization
  - reduce memory usage
- Quantization of probabilities
  - reduces memory but lose accuracy
  - probability stored in 1 byte instead of 4 bytes

# IRSTLM: Training

- Training:

```
build-lm.sh -i "gunzip -c corpus.gz" -n 3  
            -o train.irstlm.gz -k 10
```

- `-n 3` = n-gram order
- `-k 10` = split training procedure into 10 steps

- EMS:

```
irst-dir = [IRST path]  
lm-training = "$moses-script-dir/generic/trainlm-irst.perl  
              -cores NUM -irst-dir $irst-dir"
```

## New: KENLM Training

- Can train very large language models with limited RAM (on disk streaming)

```
lmplz -o [order] -S [memory] < text > text.lm
```

- `-o order` = n-gram order
- `-S memory` = How much memory to use.
  - `NUM%` = percentage of physical memory
  - `NUM[b/K/M/G/T]` = specified amount in bytes, kilo bytes, etc.

# Advanced Features

  - Speed vs. Memory
  - Speed vs. Quality

. . .

# Faster Decoding

- Multi-threaded decoding

```
.../moses --threads NUM
```

- Easy speed-up

# Advanced Features

- Faster Training
- Faster Decoding
  - Multi-threading
  - **Speed vs. Memory**
  - Speed vs. Quality

. . .

# Speed vs. Memory Use

Typical Europarl file sizes:

- Language model
  - 170 MB (trigram)
  - 412 MB (5-gram)
- Phrase table
  - 11GB
- Lexicalized reordering
  - 9.4GB

→ total = 20.8 GB

Process size  
(RAM)

# Speed vs. Memory Use

- Load into memory
  - long load time
  - large memory usage
  - fast decoding
- Load-on-demand
  - store indexed model on disk
  - binary format
  - minimal start-up time, memory usage
  - slower decoding

# Create Binary Tables

Phrase Table:

Phrase-based

```
export LC_ALL=C
cat pt.txt | sort | ./processPhraseTable -ttable 0 0 - \
    -nscores 4 -out out.file
```

```
export LC_ALL=C    ./CreateOnDiskPt 1 1 4 100 2 pt.txt out.folder
```

Hierarchical / Syntax

```
export LC_ALL=C ./CreateOnDiskPt 1 1 4 100 2 pt.txt out.folder
```

Lexical Reordering Table:

```
export LC_ALL=C
processLexicalTable -in r-t.txt -out out.file
```

Language Models (later)

# Specify Binary Tables

Change ini file

## Phrase Table

```
[feature]
PhraseDictionaryBinary name=TranslationModel0 table-limit=20 \
  num-features=4 path=../../phrase-table
```

## Hierarchical / Syntax

```
[feature]
PhraseDictionaryOnDisk name=TranslationModel0 table-limit=20 \
  num-features=4 path=../../phrase-table
```

Lexical Reordering Table  
automatically detected

# Compact Phrase Table

- Memory-efficient data structure
  - phrase table 6–7 times smaller than on-disk binary table
  - lexical reordering table 12–15 times smaller than on-disk binary table
- Stored in RAM
- May be memory mapped
- Train with `processPhraseTableMin`
- Specify with `PhraseDictionaryCompact`

# IRSTLM

81

- Developed by FBK-irst, Trento, Italy
- Create a binary format which can be read from disk as needed
  - reduces memory but slower decoding
- Quantization of probabilities
  - reduces memory but lose accuracy
  - probability stored in 1 byte instead of 4 bytes
- Not multithreaded

# IRSTLM in Moses

- Compile the decoder with IRLTLM library

```
./configure --with-irstlm=[root dir of the IRLTLM toolkit]
```

- Create binary format:

```
compile-lm language-model.srlm language-model.blm
```

- Load-on-demand:

```
rename file .mm
```

- Change ini file to use IRLTLM implementation

```
[feature]  
IRSTLM name=LM0 factor=0 path=../../lm order=5
```

# KENLM

83

- Developed by Kenneth Heafield (CMU / Edinburgh / Stanford)
- Fastest and smallest language model implementation
- Compile from LM trained with SRILM

```
build_binary model.lm model.binlm
```

- Specify in decoder

```
[feature]  
KENLM name=LM0 factor=0 path=../../model.binlm order=5
```

# New: OSM (Operations Sequence Model)

- A model that
  - considers source and target contextual information across phrases
  - integrates translation and reordering into a single model
- Convert a bilingual sentence to a sequence of operations
  - Translate (Generate a minimal translation unit)
  - Reordering (Insert a gap or Jump)
- $P(e,f,a)$  = N-gram model over resulting operation sequences
- Overcomes phrasal independence assumption
  - Considers source and target contextual information across phrases
- Better reordering model
  - Translation and reordering decisions influence each
  - Handles local and long distance reorderings in a unified manner
- No spurious phrasal segmentation problem
- Average gain of +0.40 on news-test2013 across 10 pairs

# New: OSM (Operations Sequence Model)

Sie würden gegen Sie stimmen

They would vote against you

## Operations

- $o_1$  Generate (Sie, They)
- $o_2$  Generate (würden, would)
- $o_3$  Insert Gap
- $o_4$  Generate (stimmen, vote)
- $o_5$  Jump Back (1)
- $o_6$  Generate (gegen, against)
- $o_7$  Generate (Sie, you)

Context Window

## Model:

$$p_{\text{osm}}(F, E, A) = p(o_1, \dots, o_N) = \prod_i p(o_i | o_{i-n+1} \dots o_{i-1})$$

# Advanced Features

- Faster Training
- Faster Decoding
  - Multi-threading
  - Speed vs. Memory
  - **Speed vs. Quality**

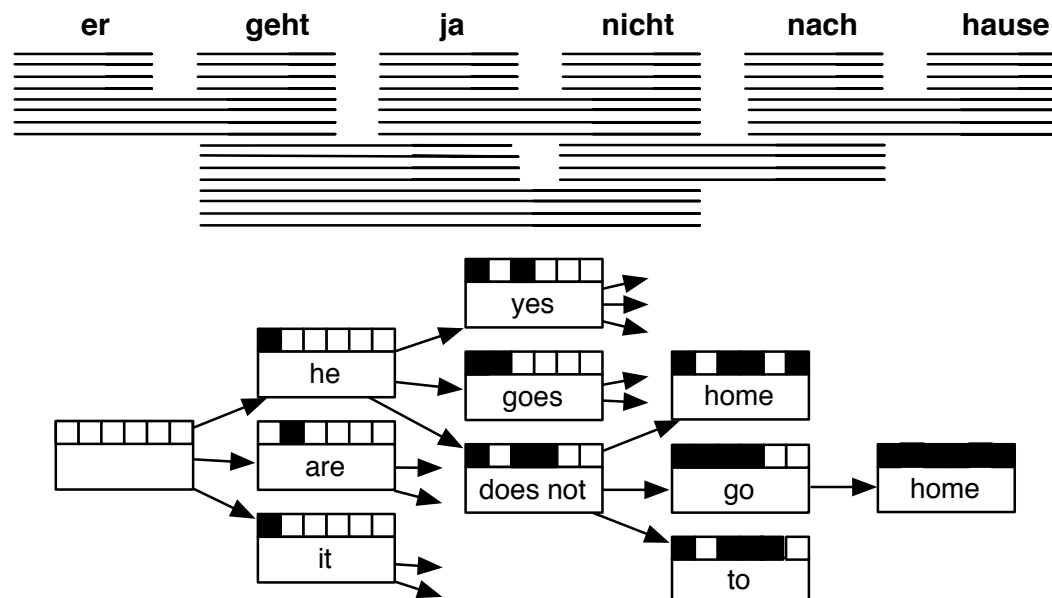

. . .

# Speed vs. Quality

# Speed vs. Quality

- Decoder search creates very large number of partial translations ("hypotheses")
- Decoding time  $\sim$  number of hypotheses created
- Translation quality  $\sim$  number of hypothesis created

# Hypothesis Stacks

- Phrase-based: One stack per number of input words covered
- Number of hypothesis created =  
sentence length  $\times$  stack size  $\times$  applicable translation options

# Pruning Parameters

- Regular beam search
  - `--stack NUM` max. number of hypotheses contained in each stack
  - `--ttable-limit NUM` max. num. of translation options per input phrase
  - search time roughly linear with respect to each number
- Cube pruning  
(fixed number of hypotheses are added to each stack)
  - `--search-algorithm 1` turns on cube pruning
  - `--cube-pruning-pop-limit NUM` number of hypotheses added to each stack
  - search time roughly linear with respect to pop limit
  - note: stack size and translation table limit have little impact in speed

# Syntax Hypothesis Stacks

- One stack per input word span
  - Number of hypothesis created =  
sentence length<sup>2</sup> × number of hypotheses added to each stack
- `--cube-pruning-pop-limit NUM` number of hypotheses added to each stack

# Advanced Features

- Faster Training
- Faster Decoding
- **Moses Server**
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Incremental Training

# Moses Server

- Moses command line:

```
.../moses -f [ini] < [input file] > [output file]
```

- Not practical for commercial use

- Moses Server:

```
.../mosesserver -f [ini] --server-port [PORT] --server-log [LOG]
```

- Accept HTTP input. XML SOAP format

- Client:

- Communicate via http
- Example clients in Java and Perl
- Write your own client
- Integrate into your own application

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- **Data and domain adaptation**
  - Train everything together
  - Secondary phrase table
  - Domain indicator features
  - Interpolated language models

# Data

- Parallel corpora → translation model
  - sentence-aligned translated texts
  - translation memories are parallel corpora
  - dictionaries are parallel corpora
- Monolingual corpora → language model
  - text in the target language
  - billions of words easy to handle

# Domain Adaptation

- The more data, the better
- The more in-domain data, the better  
(even in-domain monolingual data very valuable)
- Always tune towards target domain

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - **Train everything together**
  - Secondary phrase table
  - Domain indicator features
  - Interpolated language models

# Default: Train Everything Together

- Easy to implement
  - Concatenate new data with existing data
  - Retrain
- Disadvantages:
  - Slower training for large amount of data
  - Cannot weight old and new data separately

# Default: Train Everything Together

Specification in EMS:

- Phrase-table

```
[CORPUS]
[CORPUS:in-domain]
raw-stem = ....
[CORPUS:background]
raw-stem = ....
```

- LM

```
[LM]
[LM:in-domain]
raw-corpus = ....
[LM:background]
raw-corpus = ....
```

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - **Secondary phrase table**
  - Domain indicator features
  - Interpolated language models

## Secondary Phrase Table

- Train initial phrase table and LM on baseline data
- Train secondary phrase table and LM new/in-domain data
- Use both in Moses

```
[feature]
PhraseDictionaryMemory path=.../path.1
PhraseDictionaryMemory path=.../path.2
```

```
[mapping]
```

```
0 T 0
```

```
1 T 1
```

– Secondary phrase table

## Secondary Phrase Table

- – Secondary LM

```
[feature]  
KENLM path=.../path.1  
KENLM path=.../path.2
```

- Can give different weights for primary and secondary tables
- Not integrated into the EMS

## Secondary Phrase Table

- Terminology/Glossary database
  - fixed translation
  - per client, project, etc
- Primary phrase table
  - backoff to 'normal' phrase-table if no glossary term

```
[feature]
```

```
PhraseDictionaryMemory path=.../glossary
```

```
PhraseDictionaryMemory path=.../normal.phrase.table
```

```
[mapping]
```

```
0 T 0
```

```
1 T 1
```

```
[decoding-graph-backoff]
```

```
0
```

```
1
```

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - Secondary phrase table
  - **Domain indicator features**
  - Interpolated language models

# Domain Indicator Features

- One translation model
- Flag each phrase pair's origin
  - indicator: binary flag if it occurs in specific domain
  - ratio: how often it occurs in specific domain relative to all
  - subset: similar to indicator, but if in multiple domains, marked with multiple-domain feature
- In EMS:

```
[TRAINING]  
domain-features = "indicator"
```

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - Secondary phrase table
  - Domain indicator features
  - **Interpolated language models**

# Interpolated Language Models

- Train one language model per corpus
- Combine them by weighting each according to its importance
  - weights obtained by optimizing perplexity of resulting language model on tuning set (not the same as machine translation quality)
  - models are linearly combined
- EMS provides a section [INTERPOLATED-LM] that needs to be commented out
- Alternative: use multiple language models (disadvantage: larger process, slower)

# Advanced Features

108

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- **Instructions to decoder**
- Input formats
- Output formats
- Incremental Training

# Specifying Translations with XML

- Translation tables for numbers?

$f$	$e$	$p(f e)$
2003	2003	0.7432
2003	2000	0.0421
2003	year	0.0212
2003	the	0.0175
2003	...	...

- Instruct the decoder with XML instruction

the revenue for <num translation="2003"> 2003 </num> is higher than ...

- Deal with different number formats

er erzielte <num translation="17.55"> 17,55 </num> Punkte .

# Specifying Translations with XML

```
./moses -xml-input [exclusive | inclusive | constraint ]
```

the revenue for <num translation="2003"> 2003 </num> is higher than ...

Three types of XML input:

- Exclusive  
*Only* possible translation is given in XML
- Inclusive  
Translation is given in XML is in addition to phrase-table
- Constraint  
Only use translations from phrase-table if it match XML specification

# Constraint XML

- Specifically for translating terminology
  - consistently translate particular phrase in a document
  - may have learned larger phrase pairs that contain terminology term

- Example:

```
Microsoft <option translation="Windows"> Windows </option> 8 ...
```

- Allows use of phrase pair only if maps Windows to Windows

# Placeholders

- Translate:
  - You owe me 100 dollars !
  - You owe me 200 dollars !
  - You owe me 9.56 dollars !
- Problem: need translations for
  - 100
  - 200
  - 9.56
- Some things are better off being handled by simple rules:
  - Numbers
  - Dates
  - Currency
  - Named entities

# Placeholders

- Input

You owe me 100 dollars !

- Replace numbers with @num@

You owe me @num@ dollars !

- Specification

You owe me <ne translation="@num@" entity="100">@num@</ne> dollars !

# Walls and Zones

- Specification of reordering constraints
- Zone  
sequence to be translated without reordering with outside material
- Wall  
hard reordering constraint, no words may be reordered across
- Local wall  
wall within a zone, not valid outside zone

# Walls and Zones: Examples

- Requiring the translation of quoted material as a block

He said <zone> " yes " </zone> .

- Hard reordering constraint

Number 1 : <wall/> the beginning .

- Local hard reordering constraint within zone

A new plan <zone> ( <wall/> maybe not new <wall/> ) </zone> emerged .

- Nesting

The <zone> " new <zone> ( old ) </zone> " </zone> proposal .

# Preserving Markup

- How do you translate this:

`<h1>My Home Page</h1>`  
`I really like to <b>eat</b> chicken!`

- Solution 1: XML translations, walls and zones

```
<x translation="<h1>" /> <wall/> My Home Page <wall/>  
<x translation="</h1>" />
```

```
I really like to <zone><x translation="<b>" /> <wall/> eat <wall/>  
<x translation="</b>" /> </zone> chicken !
```

(note: special XML characters like `<` and `>` need to be escaped)

## Preserving Markup

- Solution 2: Handle markup externally

- track word positions and their markup

I	really	like	to	<b>eat</b>	chicken	!
1	2	3	4	5	6	7
-	-	-	-	<b>	-	-

- translate without markup

I really like to eat chicken !

- keep word alignment to source

Ich	esse	wirklich	gerne	Hühnchen	!
1	5	2	3-4	6	7

- re-insert markup

Ich <b>esse</b> wirklich gerne Hühnchen!

# Transliteration

- Languages are written in different scripts
  - Russian, Bulgarian and Serbian - written in Cyrillic script
  - Urdu, Farsi and Pashto - written in Arabic script
  - Hindi, Marathi and Nepalese - written in Devanagari
- Transliteration can be used to translate OOVs and Named Entities
- Problem: Transliteration corpus is not always available
- Naive Solution:
  - Crawl training data from Wikipedia titles
  - Build character-based transliteration model
  - Replace OOV words with 1-best transliteration

# Transliteration

- 2 methods to integrate into MT
- Post-decoding method
  - Use language model to pick best transliteration
  - Transliteration features
- In-decoding method
  - Integrate transliteration inside decoder
  - Words can be translated OR transliterated

# Transliteration

- EMS:

```
[TRAINING]  
transliteration-module = "yes"
```

- Post-processing method

```
post-decoding-transliteration = "yes"
```

- In-decoding method

```
in-decoding-transliteration = "yes"  
transliteration-file = /list of words to be transliterated/
```

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- **Input formats**
- Output formats
- Incremental Training

## Example: Misspelt Words

- Misspelt sentence:

The room was \*exellent but the hallway was \*filty .

- Strategies for dealing with spelling errors:
  - Create correct sentence with correction
    - ✗ problem: if not corrected properly, adds more errors
  - Create many sentences with different corrections
    - ✗ problem: have to decode each sentence, slow

# Confusion Network

The room was \*excellent but the hallway was \*filthy .

Input to decoder:

Let the decoder decide

## Example: Diacritics

- Correct sentence

Trung Quốc cảnh báo Mỹ về luật tiền tệ

- Something a non-native person might type

Trung Quoc canh bao My ve luat tien te

- Confusion network

# Confusion Network Specification

Argument on command line

```
./moses -inputtype 1
```

Input to moses

```
the 1.0  
room 1.0  
was 1.0  
excel 0.33 excellent 0.33 excellence 0.33  
but 1.0  
the 1.0  
hallway 1.0  
was 1.0  
guilty 0.5 filthy 0.5
```

# Lattice

## Example: Chinese Word Segmentation

- Unsegmented sentence

硬质合金号称"工业牙齿"

- Incorrect segmentation

硬质 合 金 号称 " 工 业牙 齿 "

- Correct segmentation

硬 质 合金 号称 " 工业 牙齿 "

# Lattice

Input to decoder:

Let the decoder decide

## Example: Compound Splitting

- Input sentence

einen wettbewerbsbedingten preissturz

- Different compound splits

- Let the decoder decide

# Lattice Specification

## Command line argument

```
./moses -inputtype 1
```

## Input to Moses (PLF format - Python Lattice Format)

```
(  
  (  
    ('einen', 1.0, 1),  
  ),  
  (  
    ('wettbewerbsbedingen', 0.5, 2),  
    ('wettbewerbs', 0.25, 1),  
    ('wettbewerb', 0.25, 1),  
  ),  
  (  
    ('bedingen', 1.0, 1),  
  ),  
  (  
    ('preissturz', 0.5, 2),  
    ('preis', 0.5, 1),  
  ),  
  (  
    ('sturz', 1.0, 1),  
  ),  
)
```

# Advanced Features

# Advanced Features

- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- **Incremental Training**

# Incremental Training

# Incremental Training

- Incremental word alignment
  - requires modified version of GIZA++  
(available at <http://code.google.com/p/inc-giza-pp/>)
  - only works for HMM alignment (not the common IBM Model 4)
- Translation model is defined by parallel corpus

```
PhraseDictionaryBitextSampling \  
  path=/path/to/corpus \  
  L1=source language extension \  
  L2=target language extension
```

# Update Word Alignment

- Uses original word alignment models  
(with additional model files stored after training)
- Incremental GIZA++ loads model
- New sentence pairs is aligned on the fly
- Typically, GIZA++ processes are run in both directions, symmetrized

# Update Translation Model

- Translation table is stored as word-aligned parallel corpus
- Update = add word aligned sentence pair
- Updating a running Moses instance via XML RPC

# Beyond Moses: CASMACAT Workbench<sup>143</sup>

have reached the run-off.

5 With a cholera epidemic raging, and more than 1m earthquake survivors still living in tents, there were fears that turnout would be low.

Con una epidemia de cólera virulentos, y más de 1 millón supervivientes del terremoto que siguen viviendo en tiendas de campaña, existen temores de que la participación será baja.
