# MOSES

## Machine Translation with Open Source Software

Hieu Hoang and Matthias Huck

October 2014

# Outline

Slides downloadable from

<http://www.statmt.org/moses/mtsummit.2013.pdf>

**09:30-10:00 Introduction**

**10:00-11:00 Hands-on Session** — you will need a laptop

**11:00-11:30 Break**

**11:30-12:30 Advanced Topics**

# Basic Idea

# Statistical Machine Translation History

## **around 1990**

Pioneering work at IBM, inspired by success in speech recognition

## **1990s**

Dominance of IBM's word-based models, support technologies

## **early 2000s**

Phrase-based models

## **late 2000s**

Tree-based models

# Moses History

- 2002** Pharaoh decoder, precursor to Moses (phrase-based models)
- 2005** Moses started by Hieu Hoang and Philipp Koehn (factored models)
- 2006** JHU workshop extends Moses significantly
- 2006-2012** Funding by EU projects EuroMatrix, EuroMatrixPlus
- 2009** Tree-based models implemented in Moses
- 2012-2015** MosesCore project. Full-time staff to maintain and enhance Moses

# Moses in Academia

- Built by academics, for academics
- Reference implementation of state of the art
  - researchers develop new methods on top of Moses
  - developers re-implement published methods
  - used by other researchers as black box
- Baseline to beat
  - researchers compare their method against Moses

# Developer Community

- Main development at University of Edinburgh, but also:
  - Fondazione Bruno Kessler (Italy)
  - Charles University (Czech Republic)
  - DFKI (Germany)
  - RWTH Aachen (Germany)
  - others...
- Code shared on [github.com](https://github.com)
- Main forum: support and developer mailing lists
- Main event: Machine Translation Marathon (next week in Prague)
  - annual open source convention
  - presentation of new open source tools
  - hands-on work on new open source projects
  - summer school for statistical machine translation

# Open Source Components

- Moses distribution uses external open source tools
  - word alignment: GIZA++, Berkeley aligner, FastAlign
  - language model: SRILM, IRSTLM, RANDLM, KENLM
  - scoring: BLEU, TER, METEOR
- Other useful tools
  - sentence aligner
  - syntactic parsers
  - part-of-speech taggers
  - morphological analyzers

## Other Open Source MT Systems

- **Joshua** — Johns Hopkins University  
<http://joshua.sourceforge.net/>
- **CDec** — University of Maryland  
<http://cdec-decoder.org/>
- **Jane** — RWTH Aachen  
<http://www-i6.informatik.rwth-aachen.de/jane/>
- **Phrasal** — Stanford University  
<http://nlp.stanford.edu/phrasal/>
- Very similar technology
  - Joshua implemented in Java, others in C++
  - Joshua and Jane support only tree-based models
  - Phrasal supports only phrase-based models
- Open sourcing tools increasing trend in NLP research

# Moses in Industry

- Distributed with LGPL — free to use
- Competitive with commercial SMT solutions (Language Weaver, Google, ...)
- But:
  - not easy to use
  - requires significant expertise for optimal performance
  - integration into existing workflow not straight-forward

# Case Studies

## **European Commission —**

uses Moses in-house to aid human translators

## **Autodesk —**

showed productivity increases in translating manuals when post-editing output from a custom-build Moses system

## **Systran —**

developed statistical post-editing using Moses

## **Asia Online —**

offers translation technology and services based on Moses

## **Many others ...**

World Trade Organisation, Adobe, Symantec, WIPO, Sybase, Safaba, Bloomberg, Pangeanic, KatanMT, Capita, ...

## Phrase-Based Model

- Foreign input is segmented in phrases
- Each phrase is translated into English
- Phrases are reordered

# Phrase Translation Options

er	geht	ja	nicht	nach	hause
he	is	yes	not	after	house
it	are	is	do not	to	home
, it	goes	, of course	does not	according to	chamber
, he	go	,	is not	in	at home
it is		not		home	
he will be		is not		under house	
it goes		does not		return home	
he goes		do not		do not	
	is		to		
	are		following		
	is after all		not after		
	does		not to		
	not				
	is not				
	are not				
	is not a				

- Many translation options to choose from

# Phrase Translation Options

er	geht	ja	nicht	nach	hause
he	is	yes	not	after	house
it	are	is	do not	to	home
, it	goes	, of course	does not	according to	chamber
, he	go		is not	in	at home
it is		not		home	
he will be		is not		under house	
it goes		does not		return home	
he goes		do not		do not	
	is		to		
	are		following		
	is after all		not after		
	does		not to		
	not				
	is not				
	are not				
	is not a				

- The machine translation decoder does not know the right answer
    - picking the right translation options
    - arranging them in the right order
- Search problem solved by heuristic beam search

# Decoding: Precompute Translation Options<sup>14</sup>

consult phrase translation table for all input phrases

# Decoding: Start with Initial Hypothesis

15

initial hypothesis: no input words covered, no output produced

# Decoding: Hypothesis Expansion

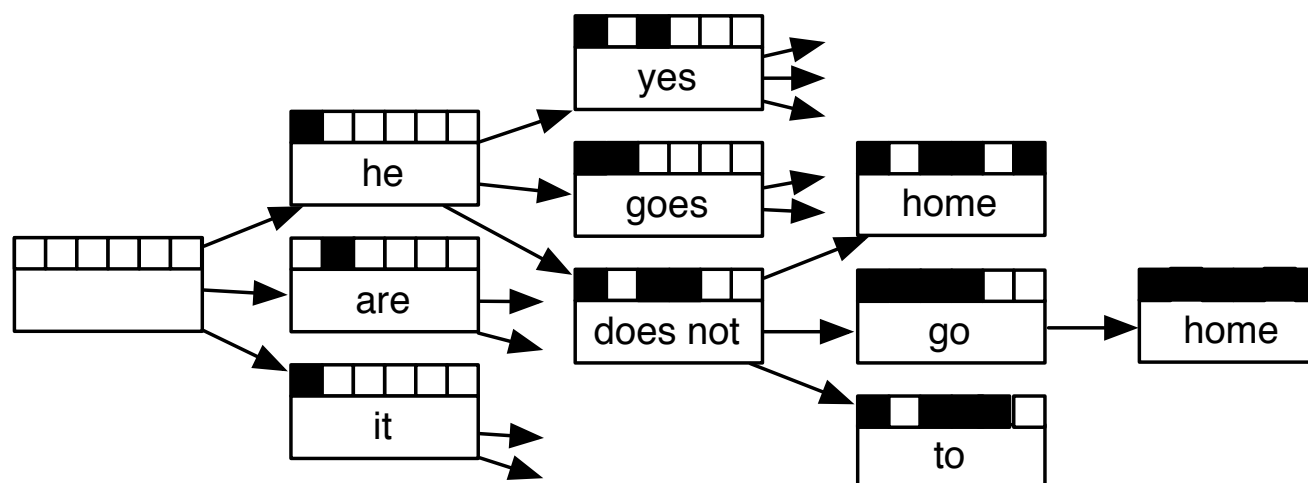

pick any translation option, create new hypothesis

# Decoding: Hypothesis Expansion

create hypotheses for all other translation options

# Decoding: Hypothesis Expansion

also create hypotheses from created partial hypothesis

# Decoding: Find Best Path

backtrack from highest scoring complete hypothesis

# Computational Complexity

- The suggested process creates exponential number of hypothesis
  - Reduction of search space: pruning
- Decoder may not find the model-best translation

# Factored Representation

- Factored representation of words

- Goals
  - generalization, e.g. by translating lemmas, not surface forms
  - richer model, e.g. using syntax for reordering, language modeling)

# Factored Model

Example:

Decomposing the translation step

Translating lemma and morphological information more robust

# Syntax Models

## String to String

John misses Mary

⇒ Marie manque à Jean

## String to Tree

John misses Mary

## Tree to String

⇒ Marie manque à Jean

## Tree to Tree

# Syntax Decoding

# Syntax Decoding

# Syntax Decoding

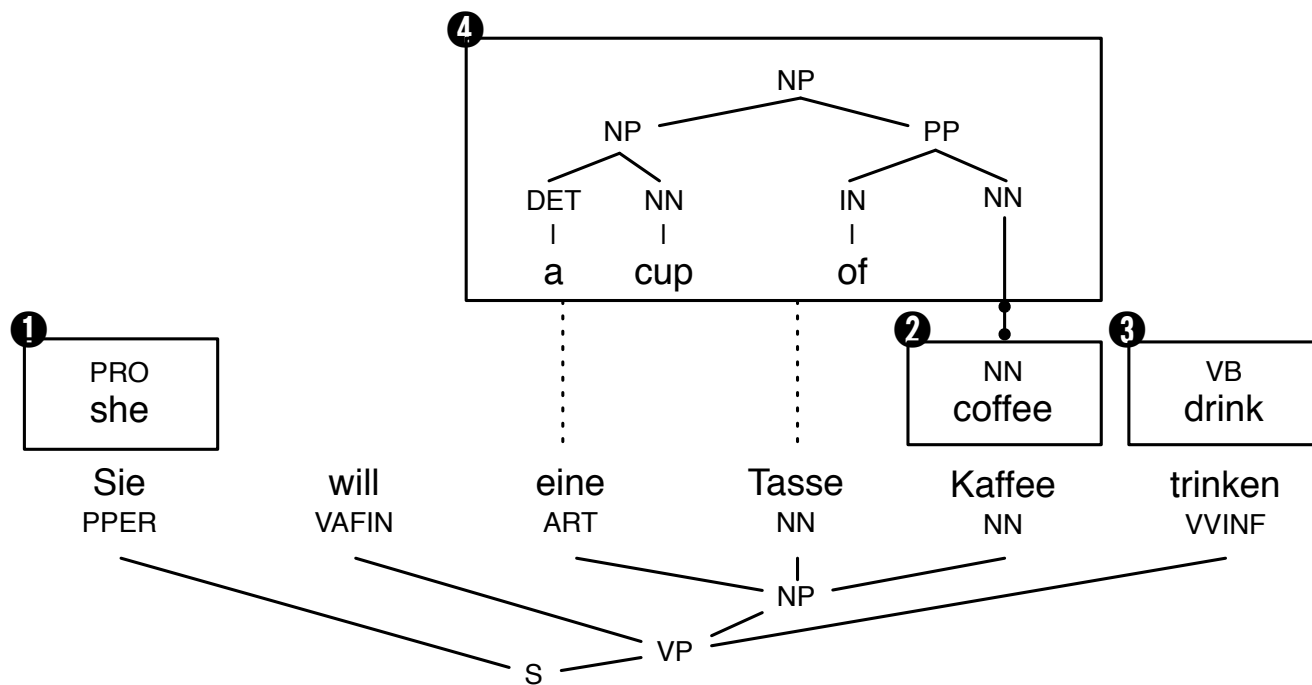

26

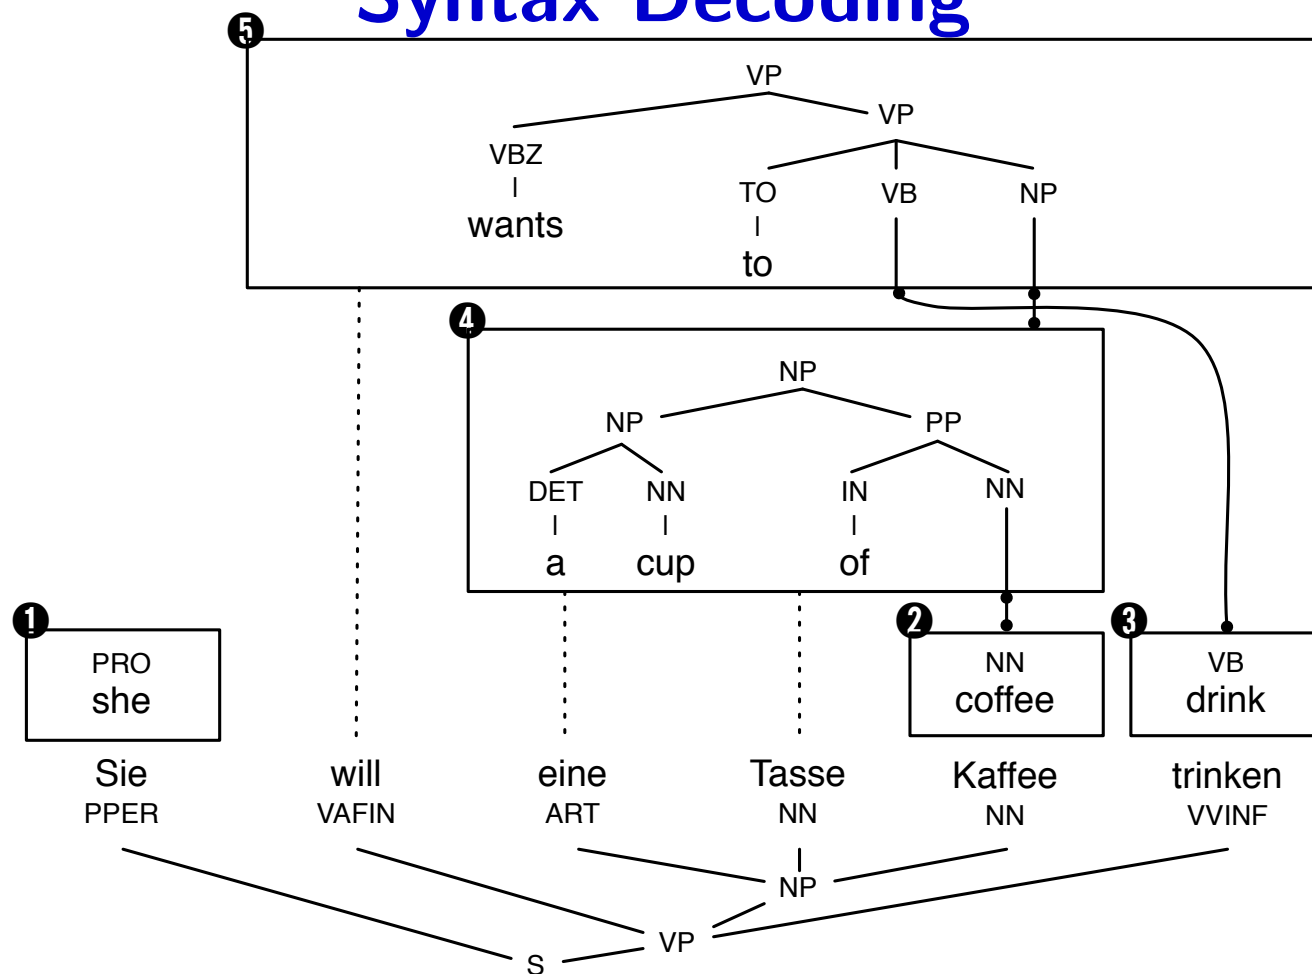

# Syntax Decoding

# Syntax Decoding

# Syntax Decoding

# Advanced Features

- **How do I get started?**
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Translation models
- Incremental Training

# How do I get started?

- Collect your data
  - Parallel data
  - Translation memories
  - Open-sourced data, eg. Europarl, UN, TAUS Data Association
  - Monolingual data
- Set up Moses
  - Download source code for Moses, GIZA++, MGIZA
  - Compile, install
  - More info: <http://www.statmt.org/moses/>
  - Prepackaged Moses: Precision Tools, MacPorts, Debian packages, M4Loc

# How do I get started?

Execute a lot of scripts

```
tokenize < corpus.en > corpus.en.tok  
lowercase < corpus.en.tok > corpus.en.lc  
...  
mert.perl ....  
moses ...  
mteval-v13.pl ...
```

Change a part of the process, execute everything again

```
tokenize < corpus.en > corpus.en.tok  
lowercase < corpus.en.tok > corpus.en.lc  
...  
mert.perl ....  
moses ...  
mteval-v13.pl ...
```

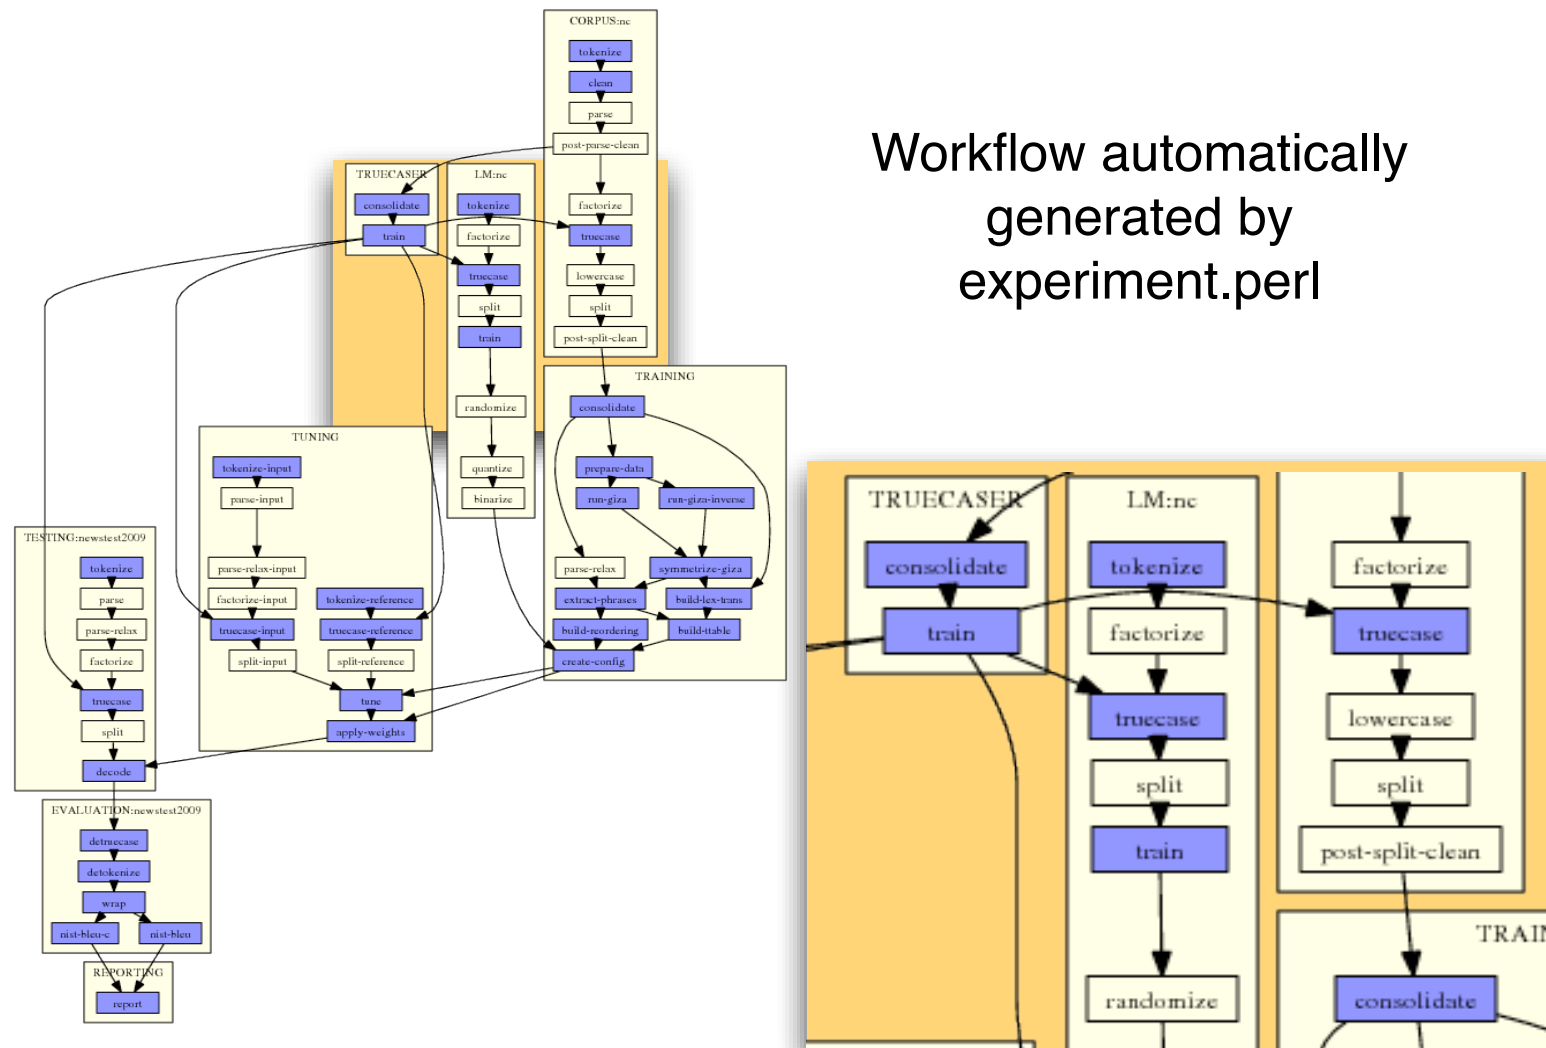

# Advanced Features

- How do I get started?
- **Experiment Management System**
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Translation models
- Incremental Training

# Experiment Management System

- One configuration file for all settings: record of all experimental details
- Scheduler of individual steps in pipeline
  - automatically keeps track of dependencies
  - runs on single machine, multi-core machine, GridEngine cluster
  - parallel execution
  - crash detection
  - automatic re-use of prior results
- Fast to use
  - set up a new experiment in minutes
  - set up a variation of an experiment in seconds
- Disadvantage — not all Moses features are integrated

Workflow automatically  
generated by  
experiment.perl

# How does it work?

- Write a configuration file (typically by adapting an existing file)

- Test:

```
experiment.perl -config config
```

- Execute:

```
experiment.perl -config config -exec
```

# Web Interface

## All Experimental Setups

ID	User	Task	Directory
<a href="#">97</a>	pkoehn	Acquis Truecased	/group/project/statmt2/pkoehn/acquis-truecase
<a href="#">96</a>	pkoehn	Chinese-English AGILE 2008	/group/project/statmt2/pkoehn/agile08-chinese

## Analysis: Output Annotation

[0.2152] This time was the reason for the collapse on Wall Street .  
[ref] This time the fall in stocks on Wall Street is responsible for the drop .

Color highlighting to indicate n-gram overlap with reference translation

darker bleu = word is part of larger n-gram match

## Analysis: Input Annotation

100 occurrences in corpus, 52 distinct translations, translation entropy: 3.08447

[#4]

- For each word and phrase, color coding and stats on
  - number of occurrences in training corpus
  - number of distinct translations in translation model
  - entropy of conditional translation probability distribution  $\phi(e|f)$  (normalized)

# Analysis: Bilingual Concordancer

[2143:0.2974] In Austria , Haider and Co. are ready to govern to prevent a red and black coalition .

[2143:0.1754] In Austria , Haider and Co. are prepared to rule to prevent a red and black coalition .

[ref] Haider and his party are ready to govern Austria in order to avoid red @-@ black coalition .

---

[2165:0.3174] The SPÖ wants to show that the cooperation of both parties is possible - in some countries and in the social partnership that is already the case .

[2165:0.2061] The SPÖ wants to show that a cooperation of both parties is possible - in some countries and in the social partnership that is already the case .

[ref] SPÖ would like to show that the cooperation of the two parties is possible - it does exist in some of the provinces as well as in social partnership .

Different words are highlighted  
sortable by most improvement, deterioration

# Hands-On Session

# Advanced Features

- How do I get started?
- Experiment Management System
- **Faster Training**
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Translation models
- Incremental Training

# Advanced Features

- How do I get started?
- Experiment Management System
- **Faster Training**
  - Tokenization
  - Tuning
  - Alignment
  - Phrase-Table Extraction
  - Train language model

...

# Faster Training

- Run steps in parallel (that do not depend on each other)

- Multicore Parallelization

```
.../train-model.perl -parallel
```

- EMS:

```
[TRAINING]  
parallel = yes
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
  - **Tokenization**
  - Tuning
  - Alignment
  - Phrase-Table Extraction
  - Train language model

...

## Faster Training

- Multi-threaded tokenization
- Specify number of threads

```
.../tokenizer.perl -threads NUM
```

- EMS:

```
input-tokenizer = "$moses-script-dir/tokenizer/tokenizer.perl  
-threads NUM "
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
  - Tokenization
  - **Tuning**
  - Alignment
  - Phrase-Table Extraction
  - Train language model

...

# Faster Training

- Multi-threaded tokenization
- Specify number of threads

```
.../mert -threads NUM
```

- EMS:

```
tuning-settings = "-threads NUM"
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
  - Tokenization
  - Tuning
  - **Alignment**
  - Phrase-Table Extraction
  - Train language model

...

# Faster Training

- Word Alignment
- Multi-threaded
  - Use MGIZA, not GIZA++

```
.../train-model.perl -mgiza -mgiza-cpus NUM
```

EMS:

```
training-options = " -mgiza -mgiza-cpus NUM "
```

- On: memory-limited machines
  - snt2cooc program requires 6GB+ memory
  - Reimplementation uses 10MB, but take longer to run

```
.../train-model.perl -snt2cooc snt2cooc.pl
```

EMS:

```
training-options = "-snt2cooc snt2cooc.pl"
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
  - Tokenization
  - Tuning
  - Alignment
  - **Phrase-Table Extraction**
  - Train language model

...

# Faster Training

- Phrase-Table Extraction
  - Split training data into NUM equal parts
  - Extract concurrently

```
.../train-model.perl -cores NUM
```

# Faster Training

- Sorting
  - Rely heavily on Unix 'sort' command
  - may take 50%+ of translation model build time
  - Need to optimize for
    - \* speed
    - \* disk usage
  - Dependent on
    - \* sort version
    - \* Unix version
    - \* available memory

## Faster Training

- Plain sorted

```
sort < extract.txt > extract.sorted.txt
```

- Optimized for large server

```
sort --buffer-size 10G --parallel 5  
    --batch-size 253 --compress-program gzip ...
```

- Use 10GB of RAM — the more the better
- 5 CPUs — the more the better
- mergesort at most 253 files
- compress intermediate files — less disk i/o

- In Moses:

```
.../train-model.perl -sort-buffer-size 10G -sort-parallel 5  
    -sort-batch-size 253 -sort-compress gzip
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
  - Tokenization
  - Tuning
  - Alignment
  - Phrase-Table Extraction
  - **Train language model**

...

# IRSTLM: Training

- Developed by FBK-irst, Trento, Italy
- Specialized training for large corpora
  - parallelization
  - reduce memory usage
- Quantization of probabilities
  - reduces memory but lose accuracy
  - probability stored in 1 byte instead of 4 bytes

# IRSTLM: Training

- Training:

```
build-lm.sh -i "gunzip -c corpus.gz" -n 3  
            -o train.irstlm.gz -k 10
```

- `-n 3` = n-gram order
- `-k 10` = split training procedure into 10 steps

- EMS:

```
irst-dir = [IRST path]  
lm-training = "$moses-script-dir/generic/trainlm-irst.perl  
              -cores NUM -irst-dir $irst-dir"
```

# KENLM: Training

- Can train very large language models with limited RAM (on disk streaming)

```
lmplz -o [order] -S [memory] < text > text.lm
```

- `-o order` = n-gram order
- `-S memory` = How much memory to use.
  - `NUM%` = percentage of physical memory
  - `NUM[b/K/M/G/T]` = specified amount in bytes, kilo bytes, etc.

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- **Faster Decoding**
- Moses Server

...

# Speed vs. Memory Use

Typical Europarl file sizes:

- Language model
  - 170 MB (trigram)
  - 412 MB (5-gram)
- Phrase table
  - 11GB
- Lexicalized reordering
  - 9.4GB

→ total = 20.8 GB

Process size  
(RAM)

# Speed vs. Memory Use

- Load into memory
  - long load time
  - large memory usage
  - fast decoding
- Load-on-demand
  - store indexed model on disk
  - binary format
  - minimal start-up time, memory usage
  - slower decoding

# Create Binary Tables

Phrase Table:

Phrase-based

```
export LC_ALL=C
cat pt.txt | sort | ./processPhraseTable -ttable 0 0 - \
    -nscores 4 -out out.file
```

```
export LC_ALL=C    ./CreateOnDiskPt 1 1 4 100 2 pt.txt out.folder
```

Hierarchical / Syntax

```
export LC_ALL=C ./CreateOnDiskPt 1 1 4 100 2 pt.txt out.folder
```

Lexical Reordering Table:

```
export LC_ALL=C
processLexicalTable -in r-t.txt -out out.file
```

Language Models (later)

# Specify Binary Tables

Change ini file

## Phrase Table

```
[feature]
PhraseDictionaryBinary name=TranslationModel0 table-limit=20 \
  num-features=4 path=/.../phrase-table
```

## Hierarchical / Syntax

```
[feature]
PhraseDictionaryOnDisk name=TranslationModel0 table-limit=20 \
  num-features=4 path=/.../phrase-table
```

Lexical Reordering Table  
automatically detected

# New: Compact Phrase Table

- Memory-efficient data structure
  - phrase table 6–7 times smaller than on-disk binary table
  - lexical reordering table 12–15 times smaller than on-disk binary table
- Stored in RAM
- May be memory mapped
- Train with `processPhraseTableMin`
- Specify with `PhraseDictionaryCompact`

# IRSTLM

77

- Developed by FBK-irst, Trento, Italy
- Create a binary format which can be read from disk as needed
  - reduces memory but slower decoding
- Quantization of probabilities
  - reduces memory but lose accuracy
  - probability stored in 1 byte instead of 4 bytes

# IRSTLM in Moses

- Compile the decoder with IRSTLM library

```
./configure --with-irstlm=[root dir of the IRSTLM toolkit]
```

- Create binary format:

```
compile-lm language-model.srilm language-model.blm
```

- Load-on-demand:

```
rename file .mm
```

- Change ini file to use IRSTLM implementation

```
[feature]  
IRSTLM name=LM0 factor=0 path=../../lm order=5
```

# KENLM

79

- Developed by Kenneth Heafield (CMU / Edinburgh / Stanford)
- Fastest and smallest language model implementation
- Compile from LM trained with SRILM

```
build_binary model.lm model.binlm
```

- Specify in decoder

```
[feature]  
KENLM name=LM0 factor=0 path=../../model.binlm order=5
```

# Advanced Features

80

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
  - Multi-threading
  - Speed vs. Memory
  - **Speed vs. Quality**

...

# Speed vs. Quality

# Speed vs. Quality

- Decoder search creates very large number of partial translations ("hypotheses")
- Decoding time  $\sim$  number of hypotheses created
- Translation quality  $\sim$  number of hypothesis created

# Hypothesis Stacks

- Phrase-based: One stack per number of input words covered
- Number of hypothesis created =  
sentence length  $\times$  stack size  $\times$  applicable translation options

# Pruning Parameters

- Regular beam search
  - `--stack NUM` max. number of hypotheses contained in each stack
  - `--ttable-limit NUM` max. num. of translation options per input phrase
  - search time roughly linear with respect to each number
- Cube pruning  
(fixed number of hypotheses are added to each stack)
  - `--search-algorithm 1` turns on cube pruning
  - `--cube-pruning-pop-limit NUM` number of hypotheses added to each stack
  - search time roughly linear with respect to pop limit
  - note: stack size and translation table limit have little impact in speed

# Syntax Hypothesis Stacks

- One stack per input word span
  - Number of hypothesis created =  
sentence length<sup>2</sup> × number of hypotheses added to each stack
- `--cube-pruning-pop-limit NUM` number of hypotheses added to each stack

# Advanced Features

86

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- **Moses Server**
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Translation models
- Incremental Training

# Moses Server

- Moses command line:

```
.../moses -f [ini] < [input file] > [output file]
```

- Not practical for commercial use

- Moses Server:

```
.../mosesserver -f [ini] --server-port [PORT] --server-log [LOG]
```

- Accept HTTP input. XML SOAP format

- Client:

- Communicate via http
- Example clients in Java and Perl
- Write your own client
- Integrate into your own application

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- **Data and domain adaptation**
  - Train everything together
  - Secondary phrase table
  - Domain indicator features
  - Interpolated language models
  - TM-MT integration

# Data

- Parallel corpora → translation model
  - sentence-aligned translated texts
  - translation memories are parallel corpora
  - dictionaries are parallel corpora
- Monolingual corpora → language model
  - text in the target language
  - billions of words easy to handle

# Domain Adaptation

- The more data, the better
- The more in-domain data, the better  
(even in-domain monolingual data very valuable)
- Always tune towards target domain

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - **Train everything together**
  - Secondary phrase table
  - Domain indicator features
  - Interpolated language models
  - TM-MT integration

# Default: Train Everything Together

92

- Easy to implement
  - Concatenate new data with existing data
  - Retrain
- Disadvantages:
  - Slower training for large amount of data
  - Cannot weight old and new data separately

# Default: Train Everything Together

Specification in EMS:

- Phrase-table

```
[CORPUS]
[CORPUS:in-domain]
raw-stem = ....
[CORPUS:background]
raw-stem = ....
```

- LM

```
[LM]
[LM:in-domain]
raw-corpus = ....
[LM:background]
raw-corpus = ....
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - **Secondary phrase table**
  - Domain indicator features
  - Interpolated language models
  - TM-MT integration

# TM-MT Integration

- Input sentence:

The second paragraph of Article 21 is deleted .

- Fuzzy match in translation memory:

The second paragraph of Article 5 is deleted .

=

À l' article 5 , le texte du deuxième alinéa est supprimé .

**Output word(s) taken from the target TM**

**Input word(s) that still need to be translated by SMT**

# TM-MT Integration

- Translation memory-style fuzzy match
  - For hierarchical decoding
  - Create long translation rule 'templates'
  - Best for use with parallel corpus with lots of repetition
- Add TM and word alignment as a special phrase table
  - Use in addition to normal phrase table

```
[ttable-file]
11 0 0 3 source-corpus;target-corpus;word-alignment
2 0 0 3 phrase table
6 0 0 3 glue-rules
```

## Secondary Phrase Table

- Train initial phrase table and LM on baseline data
- Train secondary phrase table and LM new/in-domain data
- Use both in Moses

– Secondary phrase table

```
[feature]
PhraseDictionaryMemory path=.../path.1
PhraseDictionaryMemory path=.../path.2

[mapping]
0 T 0
1 T 1
```

## Secondary Phrase Table

- – Secondary LM

```
[feature]  
KENLM path=.../path.1  
KENLM path=.../path.2
```

- Can give different weights for primary and secondary tables
- Not integrated into the EMS

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - Secondary phrase table
  - **Domain indicator features**
  - Interpolated language models
  - TM-MT integration

# Domain Indicator Features

- One translation model
- Flag each phrase pair's origin
  - indicator: binary flag if it occurs in specific domain
  - ratio: how often it occurs in specific domain relative to all
  - subset: similar to indicator, but if in multiple domains, marked with multiple-domain feature
- In EMS:

```
[TRAINING]  
domain-features = "indicator"
```

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - Secondary phrase table
  - Domain indicator features
  - **Interpolated language models**
  - TM-MT integration

# Interpolated Language Models

- Train one language model per corpus
- Combine them by weighting each according to its importance
  - weights obtained by optimizing perplexity of resulting language model on tuning set (not the same as machine translation quality)
  - models are linearly combined
- EMS provides a section [INTERPOLATED-LM] that needs to be commented out
- Alternative: use multiple language models (disadvantage: larger process, slower)

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
  - Train everything together
  - Secondary phrase table
  - Domain indicator features
  - Interpolated language models
  - **TM-MT integration**

# TM-MT Integration

- Input sentence:

The second paragraph of Article 21 is deleted .

- Fuzzy match in translation memory:

The second paragraph of Article 5 is deleted .

=

À l' article 5 , le texte du deuxième alinéa est supprimé .

**Output word(s) taken from the target TM**

**Input word(s) that still need to be translated by SMT**

# TM-MT Integration

- Translation memory-style fuzzy match
  - For hierarchical decoding
  - Create long translation rule 'templates'
  - Best for use with parallel corpus with lots of repetition
- Add TM and word alignment as a special phrase table
  - Use in addition to normal phrase table

```
[feature]
PhraseDictionaryFuzzyMatch ...
PhraseDictionaryMemory path=phrase-table.gz ...
PhraseDictionaryMemory path=glue-rules ...
```

# Advanced Features

# Specifying Translations with XML

- Translation tables for numbers?

$f$	$e$	$p(f e)$
2003	2003	0.7432
2003	2000	0.0421
2003	year	0.0212
2003	the	0.0175
2003	...	...

- Instruct the decoder with XML instruction

the revenue for <num translation="2003"> 2003 </num> is higher than ...

- Deal with different number formats

er erzielte <num translation="17.55"> 17,55 </num> Punkte .

# Specifying Translations with XML

```
./moses -xml-input [exclusive | inclusive | constraint ]
```

```
the revenue for <num translation="2003"> 2003 </num> is higher than ...
```

Three types of XML input:

- Exclusive  
*Only* possible translation is given in XML
- Inclusive  
Translation is given in XML is in addition to phrase-table
- Constraint  
Only use translations from phrase-table if it match XML specification

# Constraint XML

- Specifically for translating terminology
  - consistently translate particular phrase in a document
  - may have learned larger phrase pairs that contain terminology term

- Example:

```
Microsoft <option translation="Windows"> Windows </option> 8 ...
```

- Allows use of phrase pair only if maps Windows to Windows

# Placeholders

- Translate:
  - You owe me 100 dollars !
  - You owe me 200 dollars !
  - You owe me 9.56 dollars !
- Problem: need translations for
  - 100
  - 200
  - 9.56
- Some things are better off being handled by simple rules:
  - Numbers
  - Dates
  - Currency
  - Named entities

# Placeholders

- Input

You owe me 100 dollars !

- Replace numbers with @num@

You owe me @num@ dollars !

- Specification

You owe me <ne translation="@num@" entity="100">@num@</ne> dollars !

# Walls and Zones

- Specification of reordering constraints
- Zone  
sequence to be translated without reordering with outside material
- Wall  
hard reordering constraint, no words may be reordered across
- Local wall  
wall within a zone, not valid outside zone

## Walls and Zones: Examples

- Requiring the translation of quoted material as a block

He said <zone> " yes " </zone> .

- Hard reordering constraint

Number 1 : <wall/> the beginning .

- Local hard reordering constraint within zone

A new plan <zone> ( <wall/> maybe not new <wall/> ) </zone> emerged .

- Nesting

The <zone> " new <zone> ( old ) </zone> " </zone> proposal .

# Preserving Markup

- How do you translate this:

`<h1>My Home Page</h1>`  
I really like to `<b>eat</b>` chicken!

- Solution 1: XML translations, walls and zones

```
<x translation="<h1>" /> <wall/> My Home Page <wall/>  
<x translation="</h1>" />
```

```
I really like to <zone><x translation="<b>" /> <wall/> eat <wall/>  
<x translation="</b>" /> </zone> chicken !
```

(note: special XML characters like `<` and `>` need to be escaped)

## Preserving Markup

- Solution 2: Handle markup externally

- track word positions and their markup

I	really	like	to	<b>eat</b>	chicken	!
1	2	3	4	5	6	7
-	-	-	-	<b>	-	-

- translate without markup

I really like to eat chicken !

- keep word alignment to source

Ich	esse	wirklich	gerne	Hühnchen	!
1	5	2	3-4	6	7

- re-insert markup

Ich <b>esse</b> wirklich gerne Hühnchen!

# Advanced Features

116

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- **Input formats**
- Output formats
- Translation models
- Incremental Training

## Example: Misspelt Words

- Misspelt sentence:

The room was \*exellent but the hallway was \*filty .

- Strategies for dealing with spelling errors:
  - Create correct sentence with correction
    - ✗ problem: if not corrected properly, adds more errors
  - Create many sentences with different corrections
    - ✗ problem: have to decode each sentence, slow

# Confusion Network

The room was \*excellent but the hallway was \*filthy .

Input to decoder:

Let the decoder decide

## Example: Diacritics

- Correct sentence

Trung Quốc cảnh báo Mỹ về luật tiền tệ

- Something a non-native person might type

Trung Quoc canh bao My ve luat tien te

- Confusion network

# Confusion Network Specification

Argument on command line

```
./moses -inputtype 1
```

Input to moses

```
the 1.0  
room 1.0  
was 1.0  
excel 0.33 excellent 0.33 excellence 0.33  
but 1.0  
the 1.0  
hallway 1.0  
was 1.0  
guilty 0.5 filthy 0.5
```

# Lattice

## Example: Chinese Word Segmentation

- Unsegmented sentence

硬质合金号称"工业牙齿"

- Incorrect segmentation

硬质 合 金 号称 " 工 业牙 齿 "

- Correct segmentation

硬 质 合金 号称 " 工业 牙齿 "

# Lattice

Input to decoder:

Let the decoder decide

## Example: Compound Splitting

- Input sentence

einen wettbewerbsbedingten preissturz

- Different compound splits

- Let the decoder decide

# Lattice Specification

## Command line argument

```
./moses -inputtype 1
```

## Input to Moses (PLF format - Python Lattice Format)

```
(  
  (  
    ('einen', 1.0, 1),  
  ),  
  (  
    ('wettbewerbsbedingen', 0.5, 2),  
    ('wettbewerbs', 0.25, 1),  
    ('wettbewerb', 0.25, 1),  
  ),  
  (  
    ('bedingen', 1.0, 1),  
  ),  
  (  
    ('preissturz', 0.5, 2),  
    ('preis', 0.5, 1),  
  ),  
  (  
    ('sturz', 1.0, 1),  
  ),  
)
```

# Advanced Features

- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- **Output formats**
- Translation models
- Incremental Training

# N-Best List

- Input

es gibt verschiedene andere meinungen .

- Best Translation

there are various different opinions .

- Next nine best translations

there are various other opinions .  
there are different different opinions .  
there are other different opinions .  
we are various different opinions .  
there are various other opinions of .  
it is various different opinions .  
there are different other opinions .  
it is various other opinions .  
it is a different opinions .

## Uses of N-Best Lists

- Let the translator choose from possible translations
- Reranker
  - add more knowledge sources
  - can take global view
  - coherency of whole sentence
  - coherency of document
- Used to tune component weights

# N-Best Lists in Moses

Argument to command line

```
./moses -n-bestlist n-best.file.txt [distinct] 100
```

Output

```
0 ||| there are various different opinions . ||| d: 0 lm: -21.6664 w: -6 ... ||| -113.734
0 ||| there are various other opinions . ||| d: 0 lm: -25.3276 w: -6 ... ||| -114.004
0 ||| there are different different opinions . ||| d: 0 lm: -27.8429 w: -6 ... ||| -117.738
0 ||| there are other different opinions . ||| d: -4 lm: -25.1666 w: -6 ... ||| -118.007
0 ||| we are various different opinions . ||| d: 0 lm: -28.1533 w: -6 ... ||| -118.142

# Search Graphs in Moses

Argument to command line

```
./moses -output-search-graph search-graph.file.txt
```

Argument to command line

```
0 hyp=0 stack=0 forward=36 fscore=-113.734
0 hyp=75 stack=1 back=0 score=-104.943 ... covered=5-5 out=.
0 hyp=72 stack=1 back=0 score=-8.846 ... covered=4-4 out=opinions
0 hyp=73 stack=1 back=0 score=-10.661 ... covered=4-4 out=opinions of
```

- hyp - hypothesis id
- stack - how many words have been translated
- score - total weighted score
- covered - which words were translated by this hypothesis
- out - target phrase

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- **Translation models**
- Incremental Training

# Phrase-Based Model

- Advantages

- fast: under half a second per sentence for fast configuration
- low-memory requirement
  - \* 200-300MB for lowest configuration
  - \* suitable for netbooks and mobile devices
- outperform more complicated models for many language pairs
  - \* especially for related languages pairs

- Command line

```
./moses -f moses.ini -i in.txt > out.txt
```

- Output

```
there are various different opinions .
```

# Hierarchical Models

## Advantages

- able to model non-contiguous phrases
  - ne..pas → not
- low-memory requirement
  - 200-300MB for lowest configuration
  - suitable for netbooks and mobile devices
- outperform phrase-based models when translating between widely different languages
  - Chinese-English consistently better with hierarchical model
  - better at medium range re-ordering
- Linguistically motivated

## Disadvantages

- slower
  - 0.5 - 2 sec/sent. for fastest configuration
- more memory requirement
  - 1-2GB ram
- more disk usage
  - translation model  $\times 10$  larger than phrase-based

**Command line** `./moses_chart -f moses.ini -i in.txt > out.txt`

# Syntax Models

- Hierarchical model + use of syntactic information (constituency parser, chunkers)
- Advantage
  - Can use outside linguistic information
  - promises to solve important problems in SMT, eg. long-range reordering
- Disadvantages
  - difficult to get right
  - for many language pairs still worse than phrase-based and hierarchical models
  - need syntactic parse information
    - \* unreliable
    - \* available only for some languages
    - \* not designed for machine translation

# Phrase-Based Model Training

- Command line

```
train-model.perl ...
```

- Model

```
Bndnisse ||| alliances ||| 1 1 1 1 2.718 ||| ||| 1 1  
General Musharraf betrat am ||| general Musharraf appeared on ||| 1 1 1 1 2.718 ||| ||| 1 1
```

# Hierarchical Model

- Training

```
train-model.perl ... -hierarchical
```

- Decoding

```
./moses-chart -f moses.ini -i in.txt > out.txt
```

# Hierarchical Model

- Example rule from model

Bündnisse [X][X] Kräften [X] ||| alliances [X][X] forces [X] ||| 1 1 1 1 2.718 ||| 1-1 ||| 0.0526316 0.0526316

- Visualization of rule

## Hierarchical Model

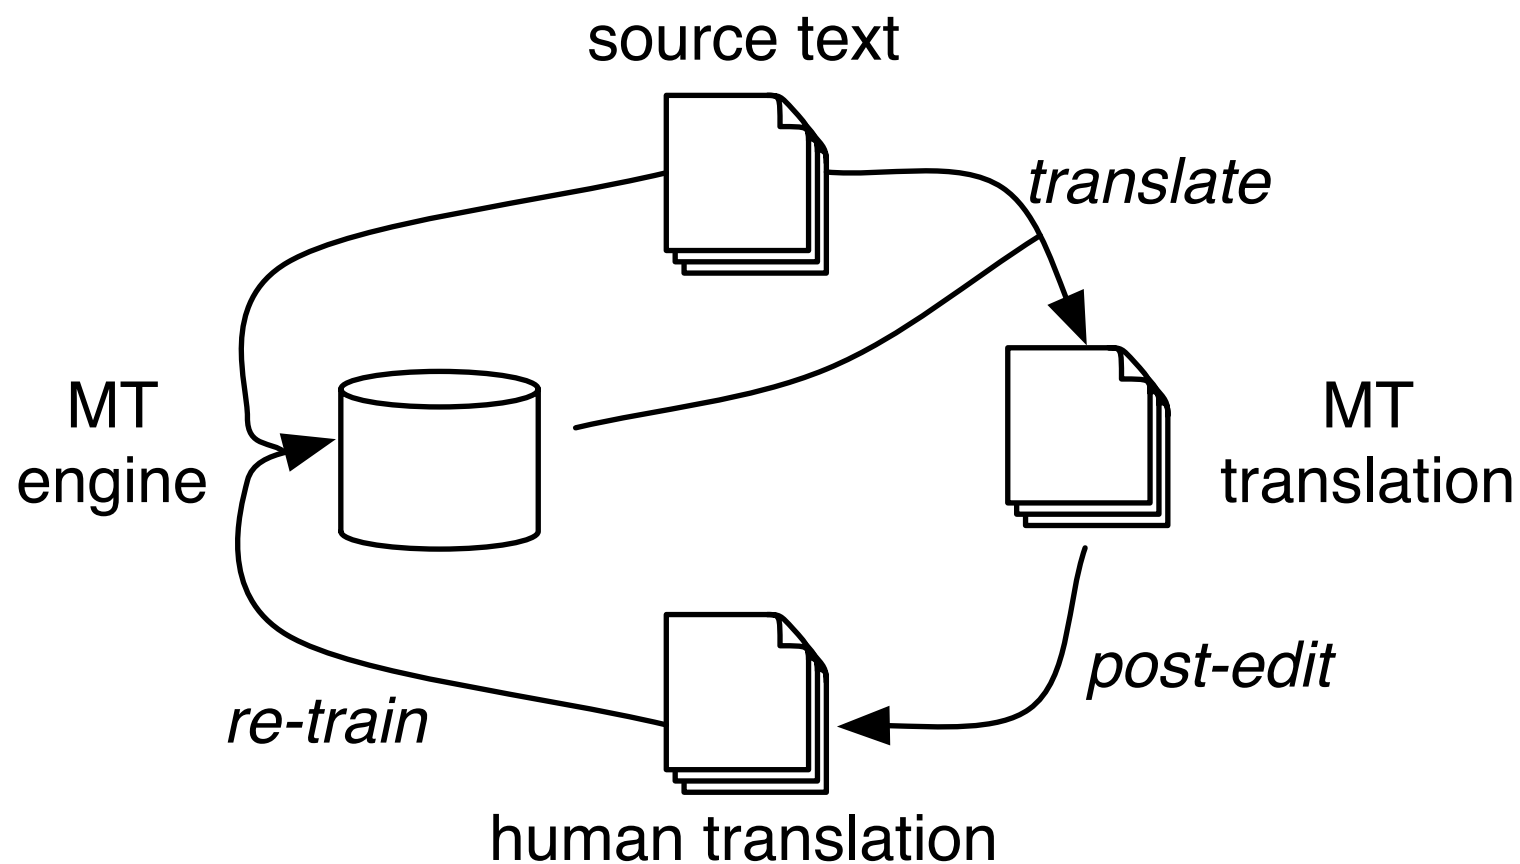

Comparison with phrase-based model:

		Phrase-based	Hierarchical
BLEU (Europarl)	fr-en	25.10	24.58
	de-en	18.11	17.99
	es-en	25.81	25.17
	de-en	18.11	17.99
	cs-en	18.00	17.86
Phrase-table size	fr-en	2.5GB	20.0GB
Decoding time (sec)	per sentence	2.27	6.45
	per word	0.09	0.26

# Advanced Features

- How do I get started?
- Experiment Management System
- Faster Training
- Faster Decoding
- Moses Server
- Data and domain adaptation
- Instructions to decoder
- Input formats
- Output formats
- Translation models
- **Incremental Training**

# Incremental Training

# Incremental Training

- Incremental word alignment
  - requires modified version of GIZA++  
(available at <http://code.google.com/p/inc-giza-pp/>)
  - only works for HMM alignment (not the common IBM Model 4)
- Translation model is defined by parallel corpus

```
PhraseDictionaryDynSuffixArray \  
  source=/.../corpus.f target=/.../corpus.e \  
  alignment=/.../model/aligned
```

# Update Word Alignment

143

- Uses original word alignment models  
(with additional model files stored after training)
- Incremental GIZA++ loads model
- New sentence pairs is aligned on the fly
- Typically, GIZA++ processes are run in both directions, symmetrized

# Update Translation Model

- Translation table is stored as word-aligned parallel corpus
- Update = add word aligned sentence pair
- Updating a running Moses instance via XML RPC

# Acknowledgements
